			Protocol Control Information Protocol Data Unit Post-build Time Configuration Pre-Compile Time Configuration

	Document Change History			
Date	Release	Changed by	Change Description	
2016-11-30	1.0.0	AUTOSAR	Probability of Failure Redundancy Risk Safety Service Data Unit •Migration of document to standard	
		Release Management	 "Foundation" Following terms added: AUTOSAR Blueprint (3.19) Bypassing (3.38) Hook (3.137) OS Event (3.174) Post-build Hooking (3.185) Pre-build Hooking (3.187) Rapid Prototyping (RP) (3.195) Rapid Prototyping Memory Interface (3.196) Rapid Prototyping Tool (3.197) Reentrancy (3.200) Standardized AUTOSAR Blueprint (3.236) Standardized Blueprint (3.238) Following terms changed: Asset (3.11) Asynchronous Function (3.13) AUTOSAR Application Interface (3.17) Availability (3.31) ECU Abstraction Layer (3.77) Feature (3.100) Function (3.127) Microcontroller Abstraction Layer (MCAL) (3.162) 	
2015-07-31	4.2.2	AUTOSAR Release Management	 Following terms changed: ECU Abstraction Layer (3.77) Standardized AUTOSAR Interface (3.237) Following terms removed: Software Module 	

Document Change History			
Date	Release	Changed by	Change Description
2014-10-31	4.2.1	AUTOSAR Release Management	 Following terms changed: Data Variant Coding (3.67) OS-Application (3.173) Post-build time configuration (3.186) Standardized AUTOSAR Interface (3.237)
2014-03-31	4.1.3	AUTOSAR Release Management	 Extended Abbreviations (0) Following terms changed: Software Component (SW-C) (3.229)
2013-03-15	4.1.1	AUTOSAR Administration	 Extended Abbreviations (0) Following terms added: Application Interface (3.4) Asynchronous Functions (3.13) AUTOSAR Application Interface (3.17) Dynamic PDU (3.73) Life Cycle (3.155) MetaDataLength (3.161) PDU MetaData (3.179) Pretended Networking (3.189) Synchronous Functions (3.245)
2011-12-22	4.0.3	AUTOSAR Administration	 Extended Abbreviations (0) Following terms added: Callback (3.40) Callout (3.41) ECU (3.76)
2009-12-18	4.0.1	AUTOSAR Administration	 Following terms added: AUTOSAR Partial Model (3.25) Bus Wake-Up (3.37) Empty Function (3.82)

	Do	cument C	hange History
Date	Release	Changed by	Change Description
2010-02-02	3.1.4	AUTOSAR Administration	 Following terms added: Automotive Safety Integrity Levels (ASIL) (3.16) Bit Position (3.34) Category 1 Interrupt (3.43) Category 2 Interrupt (3.44) Code Generator (3.50) Coordinate (3.63) E2E Profile (3.75) Error Detection Rate (3.85) Failure Rate (3.95) ICC1 (Implementation Conformance Class 1) (3.139) ICC2 (Implementation Conformance Class 2) (3.140) ICC3 (Implementation Conformance Class 3) (3.141) Interrupt Frames (3.148) Interrupt Handler (3.149) Interrupt Logic (3.150) Meta Model (3.159) Mode (3.164) Model (3.165) Network Interface (NWI) (3.169) NM Coordinator (3.171) Rate Conversion (3.198) Residual Error Rate (3.205) SAE J1939 (3.213) Safety Protocol (3.215) Software Component Interface (SW-CI) (3.230) Synchronize (3.243) Variation Binding (3.259) Variation Binding (3.259) Variation Binding Time (3.260)

	Document Change History			
Date	Release	Changed by	Change Description	
			 Variation Definition Time (3.261) Variation Point (3.262) Formal adaptations Legal disclaimer revised 	
2008-08-13	3.1.1	AUTOSAR Administration	Legal disclaimer revised	
2007-12-21	3.0.1	AUTOSAR Administration	 Following terms added: Debugging (3.69) Implementation Conformance Statement (3.142) Document meta information extended Small layout adaptations made 	
2007-01-24	2.1.15	AUTOSAR Administration	 "Advice for users" revised "Revision Information" added 	
2007-11-28	2.1.14	AUTOSAR Administration	 Following terms added: FlexRay (3.104) Vendor ID (3.263) Callback (3.40) Interrupt frames (3.148) Interrupt vector table(3.152) Accreditation (3.1) Accreditation Body (3.2) Conformance Test Agency (3.59) Assessment (3.10) Surveillance (3.242) Attestation (3.14) (Conformance) Declaration (3.70) First party and (3.101) Third party (3.252) Safety (3.214) ECU Configuration (3.78) ECU Configuration Description (3.79) Legal disclaimer revised 	
2006-05-16	2.0	AUTOSAR Administration	 removed and added some terms rework of several descriptions and some formal changes

0 Abbreviations

Abbreviation	Description
AA	Adaptive Application
ADC	Analog Digital Converter
АММ	Application Mode Management
AP	AUTOSAR Adaptive Platform
API	Application Programming Interface
ARA	AUTOSAR Runtime for Adaptive Applications
ARP	Address Resolution Protocol
ASAM	Association for Standardization of Automation and Measuring systems
ASIL	Automotive Safety Integrity Levels
ASW	Application SoftWare
ATS	Acceptance Test Suite
AUTOSAR	AUTomotive Open System Architecture
BFx	Bitfield functions for fixed point
BSW	Basic Software
BSWM	Basic SoftWare Mode manager
BSWMD	Basic SoftWare Module Description
CAN	Controller Area Network
CCF	Common Cause Failure
CDD	Complex Driver
СР	Classic Platform
СОМ	Communication
CPU	Central Processing Unit
CRC	Cyclic Redundancy Check
DAC	Digital to Analog Converter
DEM	Diagnostic Event Manager
DET	Development Error Tracer
DHCP	Dynamic Host Configuration Protocol
DIO	Digital Input/Output
DLC	Data Length Code
DolP	Diagnostics over Internet Protocol
DTD	Document Type Definition

E2E	End to End
ECU	Electronic Control Unit
EEPROM	Electrically Erasable Programmable Read-Only Memory
FIFO	First In First Out
FPU	Floating Point Unit
FW	Fire Wire
GPT	General Purpose Timer
GSM	Global System for Mobile Communication
нพ	Hardware
I-PDU	Interaction Layer Protocol Data Unit
ICC	Implementation Conformance Class
ICMP	Internet Control Message Protocol
ICOM	Intelligent COMmunication controller
ICU	Input Capture Unit
IEC	International Electrotechnical Commission
IFI	Interpolation Floating point
IFx	Interpolation Fixed point
Ю	Input/ Output
ISR	Interrupt Service Routine
L-PDU	Protocol Data Unit of the data Link layer
L-SDU	SDU of the data Link layer
LIFO	Last In First Out
LIN	Local Interconnected Network
LSB	Least Significant Bit
μC	MicroController
MCAL	Microcontroller Abstraction Layer
MCU	Micro Controller Unit
MFI	Mathematical Floating point
MFx	Math – Fixed Point
MIPS	Million Instructions Per Second
MMU	Memory Management Unit
ММІ	Man Machine Interface
MOST	Media Oriented Systems Transport
μP	MicroProcessor

MPU	Memory Protection Unit
MSB	Most Significant Bit
N-PDU	Protocol Data Unit of the Network layer (transport protocols)
N-SDU	SDU of the Network layer (transport protocols)
NVRAM	Non-Volatile Random Access Memory
OEM	Original Equipment Manufacturer
OIL	OSEK Implementation Language
OS	Operating System
OSEK	Open Systems and the Corresponding Interfaces for Automotive Electronics
PCI	Protocol Control Information
PDU	Protocol Data Unit
PS	Product Supplier
PWM	Pulse Width Modulation
RAM	Random Access Memory
RfC	Request for Change
RP	Rapid Prototyping
RTE	Runtime Environment
SAE	Society of Automotive Engineers
SDU	Service Data Unit
SIL	Safety Integrity Level
SPI	Serial Peripheral Interface
SW	Software
SW-C	Software Component
SWS	Software Specification
ТСР	Transmission Control Protocol
ТР	Transport Protocol
TTCAN	Time Triggered CAN
ТТР	Time Triggered Protocol
UDP	User (Universal) Datagram Protocol
UdpNm	UDP Network Management
USB	Universal Serial Bus
VFB	Virtual Functional Bus
VMM	Vehicle Mode Management

WCET	Worst Case Execution Time
WCRT	Worst Case Response time
ХСР	Universal Calibration Protocol
XML	Extensible Markup Language

1 Introduction

This document is the overall glossary of AUTOSAR. It contains definitions of all major terms and notions used within AUTOSAR. It does not claim to be complete and please keep in mind that some WPs have more specific terms defined within their domain specific glossary.

2 How to read this document

The title of the subchapters is identical to the term to be defined.

2.1 <Term> Template

Definition	<term be="" defined="" to=""></term>
Initiator	<functional cluster="" for="" responsible="" term="" the="" which=""></functional>
Further	<further definition="" explanation="" of="" the=""></further>
Explanations	
Comment	<comment hints="" or=""></comment>
Example	<example of="" term="" the=""></example>
Reference	<reference definition="" of=""></reference>

3 Definitions

3.1 Acceptance Test Suite

Definition	A test case description used in the context of Acceptance Testing
Initiator	Acceptance Testing
Further	ISO 9646 distinguishes between Abstract Test Suites and Executable Test Suites.
Explanations	For AUTOSAR the earlier relates to the Acceptance Test Specifications, whereas
	the latter to the test implementations or Acceptance Test Suites.
Comment	
Example	
Reference	ISO 9646, Parts 1,2 and 4

3.2 Adaptability

Definition	Adaptability is the ability of a system to adjust itself to changed circumstances in
	its environment in order to continue to provide the intended functionality.
Initiator	Safety
milator	
Further	One should distinguish between changes in the environment of the system/vehicle
Explanations	("run-time adaptability") and changes in the development environment where
-	software architecture (like AUTOSAR) is used ("design-time predictability").
Comment	
Example	
Reference	Antonio Carlos Schneider Beck, Carlos Arthur Lang Lisbôa, Luigi Carro (eds.), Adaptable Embedded Systems, Springer Science & Business Media, 27 Nov 2012
	Twan Basten, Roelof Hamberg, Frans Reckers, Jacques Verriet, Model-Based Design of Adaptive Embedded Systems, Springer Science & Business Media, 15 Mar 2013

3.3 Adaptive Application

Definition	Software that follows the Adaptive AUTOSAR specifications and therefore can be deployed onto an Adaptive Platform instance. It consists of its implementation, operational data (e.g. map data) and its metadata given by the Application Design Model. An Adaptive Application contains at least one executable. In order to be deployable on different Adaptive Platforms, it only uses ARA programming interfaces.
Initiator	Execution Management
Further	Adaptive Applications are generally more coarse grain than SW-Cs of the Classic
Explanations	Platform. They use exclusively Adaptive Platform APIs, and may offer and use
	services.
	They are implemented by one or several executables, byte code or libraries with
	defined entry points and may comprise multiple parts (e.g. libraries, data files).
Comment	The goal of Adaptive Platform is to achieve portability of Adaptive Applications
	among different implementations of the Adaptive Platform at least on source-code
	level, potentially also on object-code level.
Example	
Reference	

3.4 Adaptive Platform Foundation

Definition	Part of an Adaptive Platform implementation, which provides standardized platform functionality to Applications via software interfaces (APIs).
Initiator	Software and Architecture
Further	The Adaptive Platform Foundation includes of core system functionalities such as
Explanations	OS, Execution Manager, Communication Management and Persistency.
Comment	The goal of Adaptive Platform is to achieve portability of Adaptive Applications among different implementations of the Adaptive Platform at least on source-code level, potentially also on object-code level.
Example	
Reference	

3.5 Adaptive Platform Services

Definition	Standard platform services that is provided by an application which is part of AUTOSAR platform implementation.
Initiator	Communication
Further

3.6 Application

Definition	A software (or program) that is specified to the solution of a problem of an end user requiring information processing for its solution. The software configuration (\rightarrow definition 3.274) of a software entity.
Initiator	Software and Architecture
Further	To 1. of Definition:
Explanations	In AUTOSAR Application software is located above the AUTOSAR RTE
	(RunTimeEnvironment).
Comment	Definition 1 is the "by default" meaning for application in AUTOSAR. When
	definition 2 is meant, it has to be explicitly mentioned.
Example	
Reference	[ISO 2382-20]

3.7 Application Interface

Definition	A PortInterface (\rightarrow definition 3.212) used by a SwComponentType (\rightarrow definition 3.271) as specified in the software component template (\rightarrow definition 3.296).
Initiator	Software and Architecture
Further	
Explanations	
Comment	
Example	
Reference	[TPS_SoftwareComponentTemplate]

3.8 Application Programming Interface

Definition An Application Programming Interface (API) is the prescribed method of a specific

	software part by which a programmer writing a program can make requests to that software part.
Initiator	Software and Architecture
Further	
Explanations	
Comment	
Example	OSEK OS API (ISO 17356-3)
Reference	

3.9 Application Software Component

Definition	An Application Software Component is a specific Software Component (\rightarrow definition 3.271) which realizes a defined functionality on application level and runs on the AUTOSAR infrastructure. It communicates only through the AUTOSAR Runtime Environment.
Initiator	Software and Architecture
Further	Application Software Components are located "above" the AUTOSAR Runtime
Explanations	Environment.
Comment	
Example	
Reference	

3.10 Architecture

Definition	The fundamental organization of a system embodied in its components, their static and dynamic relationships to each other, and to the environment, and the principles guiding its design and evolution.
Initiator	Software and Architecture
Further	
Explanations	
Comment	"Static and dynamic" added to EAST definition.
Example	
Reference	[IEEE 1471], [EAST-Glossary]

3.11 Artifact

Definition	This is a Work Product Definition that provides a description and definition for tangible work product types. Artifacts may be composed of other artifacts ([14]). At a high level, an artifact is represented as a single conceptual file.
Initiator	Methodology and Templates
Further	
Explanations

Explanations	

Comment	
Example	
Reference	ISO 26262, Part 1, ID 1.7

3.13 Asserted Property

Definition	A property or quality of a design entity (e.g. SW component or system) is asserted, if the design entity guarantees that this property or quality is fulfilled.
Initiator	Software and Architecture
Further	A property or quality of a design unit can be asserted by the design unit itself or in
Explanations	combination with another design unit.
Comment	
Example	If the worst case execution time of a task (w.r.t. a certain CPU etc.) is asserted to be 3 ms, the execution time of this task will under any circumstances be less than or equal to 3 ms.
Reference	Compare required property (\rightarrow definition 3.235)

3.14 Assessment

Definition	See ISO 26262, Part 1, ID 1.4
Initiator	Safety
Further	
Explanations	
Comment	
Example	
Reference	ISO 26262, Part 1, ID 1.4

3.15 Asset

Definition	An item that has been designed for use in multiple contexts.
Initiator	Software and Architecture
Further	
Explanations	
Comment	
Example	An asset can be design, specifications, source code, documentation, test suits, manual procedures, etc From a security perspective anything that has a value to any of the stakeholders such as critical data (information, software) and critical functions, that could potentially be subject to attacks and possibly, but not necessarily, motivates countermeasures.
Reference	[IEEE 1517], [EAST-Glossary]

3.16 Asynchronous Communication

Definition	Asynchronous communication does not block the sending software entity. The sending software entity continues its operation without getting a response from the communication partner(s).
Initiator	Communication
Further	There could be an acknowledgement by the communication system about the
Explanations	sending of the information.
	A later response to the sending software entity is possible.
Comment	

Example	
Reference	

3.17 Asynchronous Function

Definition	A Function (\rightarrow definition 3.141 #2) is called asynchronous if the described functionality is not guaranteed to be completed the moment the function returns to the caller.
Initiator	Software and Architecture
Further	
Explanations	
Comment	
Example	
Reference	

3.18 Atomic Software Component

Definition	Non-composed Software-Component.
Initiator	Software and Architecture
Further	An Atomic Software Component might access HW or not, therefore not all Atomic
Explanations	SW-Cs are relocatable.
Comment	
Example	Application Software-Component, Complex Driver

3.21 AUTOSAR Adaptive Platform

Definition	An adaptive computing platform standardized by AUTOSAR. In a narrow term, it refers to its specification. In a broad term, it may refer to an instance of Adaptive
	Platform implementation.

Initiator	Software and Architecture
Further	
Explanations	
Comment	
Example	
Reference	

3.22 AUTOSAR Application Interface

Definition	A set of Blueprints (\rightarrow definition 3.41) which are standardized by AUTOSAR and which can be used for creating AUTOSAR Interfaces (\rightarrow definition 3.27) of an Application (\rightarrow definition 3.5). AUTOSAR interfaces that are derived from Standardized Blueprints (\rightarrow definition 3.284) are Standardized AUTOSAR Interfaces (\rightarrow definition 3.283).
Initiator	Application Interfaces
Further	
Explanations	
Comment	
Example	
Reference	[EXP_AIUserGuide]

3.23 AUTOSAR Authoring Tool

Definition	An AUTOSAR Tool used to create and modify AUTOSAR XML Descriptions (→
	definition 3.35).
Initiator	Methodology and Templates
Further	
Explanations	
Comment	
Example	System Description Editor
Reference	

3.24 AUTOSAR Blueprint

Definition	An AUTOSAR Blueprint is a Blueprint (→ definition 3.41) for an AUTOSAR element. It also includes that it is specified within the AUTOSAR project which attributes are mandatory to be specified for the blueprint of a specific class of AUTOSAR element types as well as how to derive an AUTOSAR object from that blueprint.
Initiator	Application Interfaces
Further Explanations	The AUTOSAR meta-model supports the pre-definition of model elements taken as the basis for further modeling. These pre-definitions are called blueprints. [TPS_STDT_00002]
Comment	
Example	
Reference	[TPS Standardization Template]

3.25 AUTOSAR Converter Tool

	An AUTOSAR Tool used to create AUTOSAR XML files by converting information from other AUTOSAR XML files.
Initiator	Methodology and Templates

Further	
Explanations	
Comment	
Example	ECU Flattener
Reference	

3.26 AUTOSAR Definition

Definition	This is the definition of parameters which can have values. One could say that the parameter values are instances of the definitions. But in the meta model hierarchy of AUTOSAR, definitions are also instances of the meta model and therefore considered as a description.
Initiator	Methodology and Templates
Further	
Explanations	
Comment	
Example	EcucParameterDef, PostBuildVariantCriterion, SwSystemconst
Reference	

3.27 AUTOSAR Interface

Definition	The AUTOSAR Interface of a software component (\rightarrow definition 3.271) refers to the collection of all ports (\rightarrow definition 3.210) of that component through which it interacts with other components.
Initiator	Software and Architecture
Further	
Explanations	
Comment	Note that an AUTOSAR Interface is different from a Port Interface (\rightarrow definition
	3.212). The latter characterizes one specific port of a component.
Example	
Reference	[AUTOSAR Specification of Virtual Functional Bus], Chapter "Modeling of
	Communication, Graphical Notation"

3.28 AUTOSAR Metamodel

Definition	The AUTOSAR metamodel is a UML2.0 model that defines the language for describing AUTOSAR systems and related artifacts.
Initiator	Methodology and Templates
Further Explanations	The AUTOSAR metamodel is a graphical representation of a template (\rightarrow definition 3.296). UML2.0 class diagrams are used to describe the attributes and their interrelationships. Stereotypes and OCL (object constraint language) are used for defining specific semantics and constraints.
Comment	The AUTOSAR XML Schema (\rightarrow definition 3.36) is derived from the AUTOSAR metamodel.
Example	
Reference	[UML 2.0]

3.29 AUTOSAR Model

Definition	This is a representation of an AUTOSAR product. The AUTOSAR model represents aspects suitable to the intended use according to the AUTOSAR methodology.
------------	---

Initiator	Methodology and Templates
Further	Strictly speaking, this is an instance of the AUTOSAR metamodel (\rightarrow definition
Explanations	3.28). The information contained in the AUTOSAR model can be anything that is
	representable according to the AUTOSAR meta-model.
Comment	
Example	
Reference	

3.30 AUTOSAR Partial Model

Definition	In AUTOSAR, the possible partitioning of models is marked in the meta-model by < <atpsplitable>>. One partial model is represented in an AUTOSAR XML description (\rightarrow definition 3.35) by one file. The partial model does not need to fulfill all semantic constraints applicable to an AUTOSAR model.</atpsplitable>
Initiator	Methodology and Templates
Further	
Explanations	
Comment	
Example	
Reference	

3.31 AUTOSAR Processor Tool

Definition	An AUTOSAR Tool used to create non-AUTOSAR files by processing information from AUTOSAR XML files.
Initiator	Methodology and Templates
Further	
Explanations	
Comment	
Example	RTE Generator
Reference	

3.32 AUTOSAR Runtime for Adaptive Applications

Definition	A set of standard application interfaces provided by Functional Clusters, which belong to either Adaptive Platform Foundation or Adaptive Platform Services.
Initiator	General
Further	
Explanations	
Comment	
Example	
Reference	

3.33 AUTOSAR Service

Definition	An AUTOSAR Service is a logical entity of the basic software (\rightarrow definition 3.38) offering general functionality to be used by various software components. The functionality is accessed via Standardized AUTOSAR Interfaces (\rightarrow definition 3.283).
Initiator	Software and Architecture
Further	
Explanations	

Comment	Parts of the basic software required to realize AUTOSAR communication patterns and communication attributes are not called AUTOSAR services.
Example	Error memory for diagnosis. Timer service. ECU state manager.
Reference	

3.34 AUTOSAR Tool

Definition	This is a software tool which supports one or more tasks defined as AUTOSAR tasks in the methodology. Depending on the supported tasks, an AUTOSAR tool can act as an authoring tool (\rightarrow definition 3.23), a converter tool (\rightarrow definition 3.25), a processor tool (\rightarrow definition 3.31) or as a combination of those.
Initiator	Methodology and Templates
Further	
Explanations	
Comment	
Example	
Reference	

3.35 AUTOSAR XML description

Definition	In AUTOSAR this means "Filled Template". In fact an AUTOSAR XML description is the XML representation of an AUTOSAR model (\rightarrow definition 3.29). The AUTOSAR XML description can consist of several files. Each individual file represents an AUTOSAR partial model (\rightarrow definition 3.30) and must validate successfully against the AUTOSAR XML schema (\rightarrow definition 3.36).
Initiator	Methodology and Templates
Further	
Explanations	
Comment	
Example	
Reference	

3.36 AUTOSAR XML Schema

Definition	The AUTOSAR XML Schema is an XML language definition for exchanging AUTOSAR models (\rightarrow definition 3.29) and descriptions.
Initiator	Methodology and Templates
Further	The AUTOSAR XML Schema is a W3C XML schema that defines the language
Explanations	for exchanging AUTOSAR models. This Schema is derived from the AUTOSAR metamodel (\rightarrow definition 3.28). The AUTOSAR XML Schema defines the AUTOSAR data exchange format.
Comment	
Example	
Reference	

3.37 Availability

Definition	1. Availability is the ability of the system to perform a function A completely
	according to its specification.
	2. The ratio of the total time the system is performing a function A (according to 1)

	· · · · · · · · · · · · · · · · · · ·
	during a given interval to the length of the interval. Alternative: The probability that
	the system is performing the function A at a specified time t
	3. In a degraded mode the system has the ability to perform a subset B of A if full
	A is not available. In this case, the functionality B is available.
Initiator	Safety
Further Explanations	Failure F ₄ Due to F ₄ - transition to the same functionality (e.g. due to redundancy) Full functionality (A)
	Failure F ₂ A System is available w.r.t functionality A Failure F ₁
	Due to F2 - transition directly to safe / alternative functionality / / Repair Repair 1 Due to F1 - transition to degraded functionality
	Alternative / Safe State functionality (C) $C \cap A \equiv \emptyset$ $C \cap B \equiv \emptyset$ C B B B B C B B C C C C C C C C C C C C C
	System is not available w.r.t any intended functionality
	Due to F ₃ - (occuring during degraded mode) transition to safe / alternative state
	NOTES: 1. This diagram assumes the system is already in full intended functionality mode and neglects the start-up, shut-down, reset, etc. transitions which lead to this state. 2. The repair transitions are conceptual transitions for ilustration purposes.
Comment	1. Degraded modes are covered by this definition (see example)
Example	1. Power Steering: if the support function fails it is not available while the steering
	as a base function has full availability.
	2. From a security perspective availability is an attribute that ensures correct and
	timely access upon demand by an authorized entity.
Reference	See ISO 26262, Part 1, ID 1.8

3.38 Basic Software

Definition	The Basic Software (BSW) provides the infrastructural (schematic dependent and schematic independent) functionalities of an ECU (\rightarrow definition 3.90). It consists of Integration Code (\rightarrow definition 3.166) and Standard Software (\rightarrow definition 3.281).
Initiator	Software and Architecture
Further	
Explanations	
Comment	
Example	MCAL, AUTOSAR services, Communication Layer
Reference	

3.39 Basic Software Module

Definition	A collection of software files (code and description) that define a certain basic software functionality present on an ECU (\rightarrow definition 3.90).
Initiator	Software and Architecture
Further	Standard software (\rightarrow definition 3.281) may be composed of several software
Explanations	modules that are developed independently. A software module may consist of

	Integration Code (\rightarrow definition 3.166), and/or standard software (\rightarrow definition 3.281).
Comment	
Example	A Digital IO Driver, Complex Driver, OS are examples of basic software modules.
Reference	

3.40 Bit Position

Definition	In AUTOSAR the bit position N within an I-PDU denotes the bit I, with I = N modulo 8, within the byte J, with $J = N / 8$. The byte J and bit position I is interpreted in accordance to the definition in OSEK COM (ISO 17356-4: COM).
Initiator	Communication
Further	
Explanations	
Comment	
Example	
Reference	

3.41 Blueprint

Definition	This is a model from which other models can be derived by copy and refinement. Note that in contrast to meta model resp. types, this process is not an instantiation.
Initiator	Methodology and Templates
Further	
Explanations	
Comment	
Example	Standardized Blueprint (\rightarrow definition 3.284) and AUTOSAR Blueprint (\rightarrow definition 3.24).
Reference	

3.42 Bulk Data

Definition	"Bulk Data" is a set of data such big in size, that standard mechanisms used to handle smaller data sets become inconvenient. This implies that bulk data in a software system are modeled, stored, accessed and transported by different mechanisms than smaller data sets.
Initiator	Software and Architecture
Further	Bulk data are typically handled by adding a level of abstraction (e.g. files) which
Explanations	separates the containment of the data from the internal structure.
Comment	The critical size, above which data must be regarded as bulk data depends on the technical infrastructure (e.g. bus system) and the considered use case (transport, storage etc.).
Example	Data on a persistent medium which has a capacity of a few kBytes (e.g. EEPROM) can be directly accessed via memory addresses, address offsets can be mapped to symbols of a programming language: No bulk data mechanisms are needed. For media with bigger capacity this becomes inconvenient or even impossible, so that a file system is used: The data are treated as bulk data.
Reference	

3.43 Bus Wake-Up

Definition	A bus wake-up is caused by a specific wake pulse on the bus defined within the specification of the dedicated communication standard (e.g. CAN, LIN, FR). A bus wake-up initiates that the transceiver and controller leave their energy saving mode and enter normal mode to start bus communication again.
Initiator	Communication
Further	
Explanations	
Comment	
Example	
Reference	

3.44 Bypassing

Definition	The experimental incorporation of new functionality within an ECU image.
Initiator	Runtime Environment
Further	Bypassing involves the incorporation of new functionality or to replace existing
Explanations	functionality to an existing ECU image without requiring that the image be rebuilt.
Comment	Bypassing can be either "internal" where the new/ replacement functionality is present on the ECU image or "external" where an RP tool (\rightarrow definition 3.227) provides the functionality out with the ECU.
Example	An RP tool intercepts the output of a bypassed RunnableEntity via the RP Memory Interface and replaces the value with the bypass result. Subsequent RunnableEntitys then process the bypass value rather than the original result.
Reference	

3.45 Calibration

Definition	Calibration is the adjustment of parameters of SW-Components realizing the control functionality (namely parameters of AUTOSAR SW-Cs, ECU abstraction or Complex Drivers (\rightarrow definition 3.63).
Initiator	Software and Architecture
Further Explanations	Only those software modules can be calibrated, which are above RTE and ECU Abstraction and CDD. Calibration is always done at post-build time. Used techniques to set calibration data include end-of-line programming, garage programming and adaptive calibration (e.g. in the case of anti-pinch protection for power window).
Comment	
Example	The calibration of the engine control will take into account the production differences of the individual motor this system will control.
Reference	

3.46 Call Point

Definition	A point in a Software-Component (\rightarrow definition 3.271) where the SW-C enforce an execution entity (Entry point \rightarrow definition 3.92) in another SW-C.
Initiator	Software and Architecture
Further	
Explanations	
Comment	
Example	Request Service
-	Send Information
Reference	
24 of 111	Document ID DEE: AUTOSAD TD Closeson

3.47 Callback

Definition	Functionality that is defined by an AUTOSAR module so that lower-level modules (i.e. lower in the Layered Software Architecture) can provide notification as required (e.g. when certain events occur or asynchronous processing completes).
Initiator	Software and Architecture
Further Explanations	In AUTOSAR, modules usually provide a register mechanism for callback functions which is set through configuration.
	A module provides callbacks so that other modules can initiate its processing while the module calls Callouts (\rightarrow definition 3.48) to execute functionality that could not be specified by AUTOSAR, i.e. integration code (\rightarrow 3.125)
Comment	
Example	(from the viewpoint of a particular SWS): The module being specified (Msws) should be informed about an event (→ definition 3.68) in another module (Mexternal). In this example, Msws calls Mexternal to perform some processing and can only resume when Mexternal completes. Upon completion, Mexternal calls Msws's callback function. That is, the called module (Mexternal) CALLS the calling module (Msws) BACK when complete ==> a callback.
Reference	

3.48 Callout

Definition	Function stubs that the system designer can replace with code to add functionality to a module which could not be specified by AUTOSAR.
Initiator	Software and Architecture
Further Explanations	 A module calls callouts to execute functionality that could not be specified by AUTOSAR, i.e. integration code while the module provides Callbacks (→ definition 3.47) so that other modules can initiate its processing. Callouts can be separated into two classes: 1) callouts that provide mandatory functionality and thus serve as a hardware abstraction layer 2) callouts that provide optional functionality
Comment	
Example	In the EcuM: For class 1): EcuM_EnableWakeupSources For class 2): The Init Lists (EcuM_AL_DriverInitZero)
Reference	

3.49 Cascaded Switch

Definition	A Cascaded Switch is an Ethernet switch that exists of at least two Ethernet switches: a master switch and a slave switch. The master switch and the slave switch are connected by uplink ports.
Initiator	Communication
Further	
Explanations	
Comment	

Example	Request Service Send Information
Reference	

3.50 Cascading Failure

Explanations	
Comment	
Example	
Reference	ISO 26262, Part 1, ID 1.13

3.51 Category 1 Interrupt

Definition	Category 1 (Cat1) Interrupts are supported by the OS but their code is only allowed to call a very small subset of OS functions. Furthermore they can bypass the OS. The code of Category 1 Interrupts depends (normally) on the used compiler and microcontroller. Category 1 Interrupts are not allowed to use the ISR() macro. Category 1 Interrupts need to implement/establish their own Interrupt Frame. Nevertheless they have to be configured in order to be included in the Interrupt Vector Table.
Initiator	Software and Architecture
Further	
Explanations	
Comment	
Example	
Reference	

3.52 Category 2 Interrupt

Definition	Category 2 (Cat2) Interrupts are supported by the OS and their code can call a subset of OS functions. The definition of the Cat2 Interrupt must use the ISR() macro in order to be recognized by the OS. The Interrupt Frame of a Category 2 Interrupt is managed by the OS.
Initiator	Software and Architecture
Further	
Explanations	
Comment	
Example	ISR(timer1) { /* here is the code which handles timer1 interrupts */ }
Reference	

3.53 Causality of Transmission

Definition	Transmit order of PDUs with the same identifier (instances of PDUs) from a source network is preserved in the destination network.
Initiator	Communication

Further Explanations	Transmission of PDUs (\rightarrow definition 3.204) with the same identifier has a particular temporal order in a given source network. After routing over a gateway the temporal order of transmission of PDUs in a destination network may be changed. Only in case that the temporal order is the same, causality is given. Otherwise causality is violated. Causality can be in contradiction to prioritization of PDUs.
Comment	
Example	
Reference	

3.54 Classic Platform

Definition	Software Platform defined by AUTOSAR for deeply embedded systems and Application Software with high demands regarding predictability, safety and responsivness.
Initiator	General
Further	
Explanations	
Comment	
Example

3.55 Client

Definition	Software entity which uses services of a server (\rightarrow definition 3.260).
Initiator	Software and Architecture
Further	The client and the server might be located on one ECU (\rightarrow definition 3.90) or
Explanations	distributed on different calculation units (e.g. ECU, external diagnostic tester).
Comment	Adapted from Balzert.
Example	
Reference	[Balzert99]

3.56 Client-Server Communication

Definition	A specific form of communication in a possibly distributed system in which software entities act as clients (\rightarrow definition 3.54), servers (\rightarrow definition 3.260) or both, where 1n clients are requesting services via a specific protocol from typically one server.
Initiator	Communication
Further Explanations	 Client-server communication can be realized by synchronous or asynchronous communication. Client takes initiative: requesting that the server performs a service, e.g. client triggers action within server (server does not start action on its own) Client is after service request blocked / non-blocked Client expects response from server: data flow (+ control flow, if blocked) One example for 1 client to n server communication (currently not supported) is a functional request by diagnosis. This has to be treated as a specific exception.
Comment	Adapted from Hyper Dictionary
Example	Internet (TCP/IP)
Reference	[Hyper Dictionary]

3.57 Client-Server Interface

Definition	The client-server interface is a special kind of port-interface (\rightarrow definition 3.212) used for the case of client-server communication (\rightarrow definition 3.56). The client-server interface defines the operations that are provided by the server (\rightarrow definition 3.260) and that can be used by the client (\rightarrow definition 3.54).
Initiator	Communication
Further	
Explanations	
Comment	
Example	
Reference	[AUTOSAR Specification of Virtual Functional Bus]

3.58 Cluster Signal

Definition	A cluster signal represents the aggregating system signal on one specific communication cluster. Cluster signals can be defined independently of frames. This allows a development methodology where the signals are defined first, and are assigned to frames in a later stage.
Initiator	Communication
Further	
Explanations	
Comment	
Example	
Reference	

3.59 Code Generator

Definition	The Code Generator consumes complete and correctly formed XML for a BSW module and generates code and data that configures the module.
Initiator	Software and Architecture
Further	
Explanations	
Comment	
Example	
Reference	[AUTOSAR_InterruptHandling_Explanation.doc]

3.60 Code Variant Coding

Definition	Adaptation of SW by selection of functional alternatives according to external requirements
Initiator	Software and Architecture
Further Explanations	Code Variant Coding might influences RTE (RuntimeEnvironment) and BSW modules (→ definition 3.39), not only the application software modules. Code Variant Coding is always done at pre-compile time or at link time. Code Variant Coding also includes vehicle-specific (not user-specific) SW adaptation due to end-customer wishes (e.g. deactivation of speed dependent automatic locking).
Comment	In case of the C language the #if or #ifdef directive can be used for creating code variants. Code Variant Coding is a design time concept.
Example	The same window lifter ECU is used for cars with 2 and 4 doors, however different code segments have to be used in both cases.

Explanations	
Comment	
Example	
Reference	ISO 26262, Part 1, ID 1.14

3.62 Communication Attribute

Definition	Communication attributes define, according to the development phase, behavioral as well as implementation aspects of the AUTOSAR communication patterns.
Initiator	Communication
Further	The exact characteristics of the communication patterns provided by AUTOSAR
Explanations	(client-server and sender-receiver) can be specified more precisely by communication attributes.
Comment	See chapter 4.1.6 in Specification of the Virtual Functional Bus
Example	
Reference	[AUTOSAR Specification of Virtual Functional Bus]

3.63 Complex Driver

Definition	A software entity not standardized by AUTOSAR that can access or be accessed via AUTOSAR Interfaces (\rightarrow definition 3.27) and/ or Basic Software Modules (\rightarrow definition 3.39) APIs.
Initiator	Software and Architecture
Further	CDD used to be the acronym for Complex Device Driver, but is not limited to
Explanations	drivers.
Comment	
Example	 Communication stack CDD to support the communication on a bus not supported by AUTOSAR Reuse of legacy SW Integration of software with high HW interraction requirements within a standardized AUTOSAR Architecture
Reference	

3.64 Composition

Definition	An AUTOSAR Composition encapsulates a collaboration of software components (→ definition 3.271), thereby hiding detail and allowing the creation of higher abstraction levels. Through Delegation Connectors (→ definition 3.69) a Composition (→ definition 3.64) explicitly specifies, which Ports (→ definition 3.210) of the internal components are visible from the outside. AUTOSAR Compositions are a type of Components, e.g. they can be part of further compositions.
Initiator	Software and Architecture
Further	
Explanations	
Comment	See Virtual Functional Bus Specification, Chapter "VFB View, Meta-Model
Example	

Δυτ⊘sΔr

Reference [AUTOSAR Specification of Virtual Functional Bus]

3.65 Compositionality

Definition	Compositionality is given when the behavior of a software component or subsystem of a system is independent of the overall system load and configuration.
Initiator	Software and Architecture
Further	Compositionality is an important property of deterministic systems. This property
Explanations	leads to a complete decoupling of systems. Smooth subsystem integration without
	backlashes is then easily achievable.
Comment	
Example	A new component or a subsystem can be added to a system without changing the
	behavior of the original components.
Reference	

3.66 Conditioned Signal

Definition	The conditioned signal is the internal electrical representation of the electrical signal within the ECU. It is delivered to the processor and represented in voltage and time (or, in case of logical signals, by high or low level).
Initiator	General
Further Explanations	The Electrical Signal (\rightarrow definition 3.86) usually can not be processed by the peripherals directly, but has to be adopted. This includes amplification and limitation, conversion from a current into a voltage and so on. This conversion is performed by some electronical devices in the ECU and the result of the conversion is called the Conditioned Signal. The description means for the Conditioned Signal can also be the same as for Technical Signals (\rightarrow definition 3.295) and Electrical Signals, but limited to electrical voltage
Comment	
Example	
Reference	

3.67 Configuration

Definition	The arrangement of hardware and/or software elements in a system.
Initiator	Software and Architecture
Further	A configuration in general takes place before runtime.
Explanations	
Comment	
Example	
Reference	[AST-Glossary], [SO 61511-1]

3.68 Confirmation

Definition	Service primitive defined in the ISO/OSI Reference model (ISO 7498). With the 'confirmation' service primitive a service provider informs a service user about the result of a preceding service request of the service user.
Initiator	Software and Architecture
Further	A confirmation is e.g. a specific notification generated by the underlying layer to
Explanations	inform about a Message Transmission Error.

Comment	
Example	
Reference	[SEK BD]

3.69 Connector

Definition	A connector connects ports (\rightarrow definition 3.210) of software components (\rightarrow definition 3.271) and represents the flow of information between those ports.
Initiator	Software and Architecture
Further	
Explanations	
Comment	For more information see AUTOSAR Specification of VFB
Example	AssemblyConnector, DelegationConnector
Reference	[AUTOSAR Specification of Virtual Function Bus]

3.70 Control Flow

Definition	The directed transmission of information between multiple entities, directly resulting in a state change of the receiving entity.
Initiator	Software and Architecture
Further	A state change could result in an activation of a schedulable entity.
Explanations	
Comment	
Example	
Reference	

3.71 Coordinate

Definition	To control and harmonize two or more events or operations to act in an organized and predictable way.
Initiator	Communication
Further	
Explanations	
Comment	
Example	Two NM Channels can be coordinated to synchronize different stages of network sleep.
Reference	AUTOSAR Generic NM Interface

3.72 Data

Definition	A reinterpretable representation of information in a formalized manner suitable for communication, interpretation or processing.
Initiator	General
Further	
Explanations	
Comment	
Example	Flag, Notification, etc.
Reference	[ISO 2382-1]

3.73 Data Element

Definition	Data elements are declared within the context of a "Sender-Receiver Interface" (\rightarrow definition 3.258). They serve as the data units that are exchanged between sender and receiver.
Initiator	Software and Architecture
Further	
Explanations	
Comment	
Example	
Reference	[AUTOSAR SoftwareComponentTemplate]

3.74 Data Flow

Definition	The directed transmission of data (\rightarrow definition 3.72) between multiple entities. The transmissioned data are not directly related to a state change at the receiver side.
Initiator	Software and Architecture
Further	
Explanations	
Comment	
Example	Asynchronous communication.
Reference	

3.75 Data Variant Coding

Definition	Adaptation of SW by setup of certain characteristic data according to external requirements.
Initiator	Software and Architecture
Further	Data Variant Coding might influences RTE (RunTimeEnvironment) and BSW
Explanations	modules (\rightarrow definition 3.39) not only the application software modules (Multiple
	configuration parameter sets are needed). Variant Coding also includes vehicle-
	specific (not user-specific) SW adaptation due to end-customer wishes (e.g.
	deactivation of speed dependent automatic locking). Used techniques to select
	variants include end-of-line programming and garage programming.
Comment	The major difference with calibration is that this later doesn't aim to adapt the SW
	functionality itself but only aims to adjust the characteristic data of the SW to the
	HW/SW environment. Characteristic data in the source code of a software function
	have a significant impact on the functionality of the software.
Example	- Steering wheel controller adaptation to the left or right side can be done with
	Variant Coding. (Selection of the configuration.)
	- Country related adaptation of MMI with respect to speed and/or temperature unit
	(km/h vs. mph, °C vs. F).
Reference	

3.76 Deadline

Definition	The point in time when an execution of an entity must be finished.
Initiator	Software and Architecture
Further	A deadline is calculated dependent on its local reference system.
Explanations	
Comment	
Example	

Reference

[OS Specification]

3.77 Debugging

Definition	Debugging is the process of gathering information in case of a software problem. The information is used to analyze the software problem.
Initiator	Software and Architecture
Further Explanations	To analyze and later fix a software problem, in many cases more information than the one provided by the software API is necessary. This can be for example the state of internal variables of the software or a trace of the communication. The information can be collected by different means, e.g. an emulator or a tracing tool for the communication bus.
Comment	
Example	
Reference	

3.78 Dependability

Definition	Dependability is defined as the trustworthiness of a computer system such that reliance can justifiable be placed on the service it delivers.
Initiator	Software and Architecture

3.83 Dynamic PDU

Definition	
Definition	PDU (\rightarrow definition 3.204) with dynamic identifier.
Initiator	Communication
Further	Dynamic PDUs are PDUs where the <bus> identifier (e.g. CAN ID) is dynamically</bus>
Explanations	assigned (transmission) or evaluated (reception) at run time.
Comment	AUTOSAR supports two types of dynamic PDUs in Canlf: Canlf_SetDynamicTxId
	(only transmission), and PDUs with MetaData (reception and transmission).
Example	PDU with variable source address, encoded in the CAN ID, e.g. ISO15765
-	NormalFixed.
Reference	

3.84 Dynamic Routing

Definition	The routing of signals or PDUs (\rightarrow definition 3.204) in a gateway can be changed
	throughout operation without change of the operation mode of the gateway.
Initiator	Communication
Further	Dynamic routing requires the change of routing tables during operation. It is not
Explanations	intended to use dynamic routing in the gateway.
Comment	
Example	
Reference	[EAST-Glossary]

3.85 E2E Profile

A functional and complete description of a specific communication stack in terms of data structures, services, behavioral state-machines, error handling. E2E
Profiles are defined in AUTOSAR E2E Library. An E2E Profile is configurable by

	runtime parameters. A specific set of runtime parameters is called E2E profile variant. In order to reach interoperability, the application developers should use the E2E profile variants defined in the E2E library.

3.86 ECU Abstraction Layer

Definition	The ECU Abstraction Layer is located above the Microcontroller Abstraction Layer (→ definition 3.188) and abstracts from the ECU schematic. It is implemented for a specific ECU and offers an API for access to peripherals and devices regardless of their location (onchip/offchip) and their connection to the microcontroller (port pins, type of interface). Task: Make higher software layers independent of the ECU hardware layout.
Initiator	Software and Architecture
Further	The ECU Abstraction Layer consists of the following parts:
Explanations	I/O Hardware Abstraction
	Communication Hardware Abstraction
	Memory Hardware Abstraction
	Crypto Hardware Abstraction
	Onboard Device Abstraction
	Properties:
	 Implementation: µC independent, ECU hardware dependent
	 Upper Interface (API): µC and ECU hardware independent, dependent on signal type
Comment	
Example	See Layered Software Architecture
Reference	[AUTOSAR SoftwareArchitecture]

3.87 ECU Configuration

Definition	Activity of integrating and configuring one ECU's software.
Initiator	Methodology and Templates
Further Explanations	Further Explanations: ECU Configuration denotes the activity when one ECU's software is set up for a specific usage inside the ECU. In AUTOSAR the ECU
Explanations	Configuration activity is divided into "Pre-compile time", "Link time" and "Post-build time" configuration.
Comment	
Example	
Reference	ECU Configuration Description (\rightarrow definition 3.88), Pre-compile time configuration (\rightarrow definition 3.216), Link time configuration (\rightarrow definition 3.178), Post-build time configuration (\rightarrow definition 3.214), Multiple Configuration Sets (\rightarrow definition 3.194).

3.88 ECU Configuration Description

Definition	Output of the ECU Configuration activity containing the values of configuration parameters and references.
Initiator	Methodology and Templates
Further	ECU Configuration Description holds the configuration parameter values and
Explanations	references to other module's configurations which have been defined in the ECU

	Configuration activity.
Comment	ECU Configuration Description may contain the whole ECU Configuration information or only the parts relevant for a specific configuration step (e.g. Precompile time).
Example	
Reference	ECU Configuration Description (\rightarrow definition 3.88), Pre-compile time configuration (\rightarrow definition 3.216), Link time configuration (\rightarrow definition 3.178), Post-build time configuration (\rightarrow definition 3.214), Multiple Configuration Sets (\rightarrow definition 3.194).

3.89 Electrical Signal

Definition	The electrical signal is the electrical representation of technical signals (\rightarrow definition 3.295). Electrical signals can only be represented in voltage, current and time
Initiator	General
Further	When a sensor processes the Technical Signal it is converted into an Electrical
Explanations	Signal. The information can be provided in the current, the voltage or in the timely
	change of the signal (e.g. a pulse width modulation).
Comment	To describe the Electrical Signal the same means as for the Technical Signal can
	be used, limited to electrical current and voltage.
Example	
Reference	

3.90 Electronic Control Unit

Definition	Embedded computer system consisting of at least one CPU and corresponding peripherals which are placed in one housing.
Initiator	General
Further	An ECU is typified by a connection to one or more in-vehicle networks, sensors
Explanations	and actuators.
Comment	
Example	
Reference	

3.91 Empty Function

Definition	Any C function defined by an AUTOSAR specification which does not implement or alter behavior required to accomplish the assigned functional responsibility.
Initiator	Software and Architecture
Further Explanations	As such an empty function in the context of AUTOSAR can still have code but this code shall not impact the state machine other than error reporting. Auxiliary code like validating arguments to report to the DET does not constitute functional behavior because without the code and proper calling this code would still fulfill its architectural responsibility.
Comment	
Example

3.96 Event

Definition	State change of a hardware and/or software entity.
Initiator	Software and Architecture
Further	See OS Event (\rightarrow definition 3.201), RTE Event (\rightarrow definition 3.242), Diagnostic
Explanations	Event (\rightarrow definition 3.79) and Event Message (SOME/IP) (\rightarrow definition 3.97)
Comment	
Example	
Reference	

3.97 Event Message (SOME/IP)

Definition	Event – a message sent by an ECU implementing a service instance to an ECU
	using this service instance (Publish/Subscribe).
Initiator	Communication
Further	Eventgroup – a logical grouping of 1 or more events. An eventgroup is part of a
Explanations	service.
Comment	
Example	
Reference	

3.98 Executable

Definition	Part of an application which consists of either a file containing executable code with a defined entry point and suitable for the platform instance as the target of deployment (deployment time) or software code which is ready to be integrated for a specific platform.
Initiator	Execution Management
Further Explanations	In POSIX systems, an executable is typically running within a single process (\rightarrow definition 3.222). Therefore, intra-executable communication is different from inter- executable communication and should therefore be considered during design time of an executable.
Comment	
Example	
Reference	

3.99 Execution Time

Definition	The time during which a program is actually executing, or more precisely during which a certain thread of execution is active.
Initiator	Software and Architecture
Further Explanations	The execution time of software is the time during which the CPU is executing its instructions. The time the CPU spends on task switches or on the execution of other pieces of software is not considered here. See also: response time, worst case execution time, worstcase response time.
Comment	
Example	
Reference	

3.100 Exit Point

Definition	A point in a Software-Component (\rightarrow definition 3.271) where an execution entity of
	the SW-C ends.
Initiator	Software and Architecture

3.109 Fault Detection

The action of monitoring errors and setting fault states to specific values is called
fault detection.
Software and Architecture
The different states are called "not detected"/ "present"/ "intermittent or
maturing"/
The names of the fault states are following the ISO/SAE norms; however there is
a coordination step in between the states of the DTCs (Diagnostic Trouble Code

	⇒ see definition in ISO 15765/ ISO14229) and the states of the faults. The SW-C's Fault Detection is executed decentralized, e.g. each SW-C sets the state of a fault according to the defined fault qualification (SW-C Template). Therefore the Fault Detection is implemented in the SW-C (SW-C could be either Application SW Component or Basic SW Component). There are exceptions; these will be pointed out individually for each fault. The SW-C's developer will define the conditions (=fault qualification), when these conditions are fulfilled the SW-C notifies a fault to the Diagnostic Memory Management.
Comment	
Example	
Reference	[ISO 15765], [ISO14229]
	[AUTOSAR Specification of Virtual Functional Bus]

3.110 Fault Reaction

Definition	In case of a Failure of a SW-C there is a specific action to be carried out. This action is called "Fault Reaction".
Initiator	Software and Architecture
Further	
Explanations	
Comment	
Example	Fault Reactions can be implemented decentralized in the SW-C. There might also be the need of coordinating the fault reactions since there are reactions excluding each other. This will be done by a central fault reaction manager.

3.116 FlexRay Base Cycle

Definition	One operand of the equation used to calculate the Cycle Numbers (\rightarrow definition 3.122) of the FlexRay Cells (\rightarrow definition 3.118) being used for periodic transmission of FlexRay Frames (\rightarrow definition 3.125) in a given FlexRay Slot (\rightarrow definition 3.134). Equation: Cycle Number = (B + n * 2^R) _{mod64} Where: • Base Cycle B = 0 63 • Cycle Repetition 2 ^R = 2 ⁰ 2 ⁶ = 1, 2, 4, 8, 64 • Variable n = 0 64 • B < 2 ^R (See also graphic in FlexRay L-SDU-Identifier \rightarrow definition 3.129)
Initiator	Communication
Further Explanations	
Comment	Synonym: "Cycle Offset", "Cycle Counter Offset"
Example	
Reference	

3.117 FlexRay Bus

Definition	A communication system topology in which Nodes (\rightarrow definition 3.132) are directly connected to a single, common communication media (as opposed to connection through Stars (\rightarrow definition 3.137), gateways, etc.). The term "bus" is also used to refer to the media itself.
Initiator	Communication
Further	The term "FlexRay Bus" is not to be confused with the term "FlexRay Cluster" (\rightarrow
Explanations	definition 3.120) or "FlexRay Network" (\rightarrow definition 3.131).
Comment	Synonym: "FlexRay Communication Bus"
Example	
Reference	[FR_PROTOCOL]

3.118 FlexRay Cell

Definition Initiator Further Explanations	One element in a FlexRay Matrix (\rightarrow definition 3.130) unequivocally defined by a combination of exactly one FlexRay Slot (or FlexRay Slot Number) (\rightarrow definition 3.134) and exactly one FlexRay Cycle (or FlexRay Cycle Number) (\rightarrow definition 3.121). In other words: a FlexRay Cell is defined by the tuple <slot cycle="" number="" number,="">. Each FlexRay Cell represents one (possible) transmission time interval for at most one FlexRay Frame (\rightarrow definition 3.125). If a FlexRay Network (\rightarrow definition 3.131) consists of two Channels (\rightarrow definition 3.119), there is one FlexRay Matrix per Channel , so there are also two FlexRay Cells defined by the same tuple <slot cycle="" number="" number,="">, one for "Channel A" and one for "Channel B". Communication In order to achieve periodic transmission of FlexRay Frames in a given FlexRay Slot, the Cycle Numbers of the FlexRay Cells being used for transmission have to fulfill the following equation: Cycle Number = (B + n * 2^R)_{mod64} Where: • Base Cycle B = 0 63 • Cycle Repetition 2^R = 2⁰ 2⁶ = 1, 2, 4, 8, 64 • Variable n = 0 64</slot></slot>
0	• B < 2 ^R
Comment Example Reference	Synonym: "FlexRay Matrix Cell"

3.119 FlexRay Channel

Definition	The inter-Node (\rightarrow definition 3.132) connection through which signals are conveyed for the purpose of communication. The communication channel abstracts both the network topology, i.e., Bus (\rightarrow definition 3.117) or Star (\rightarrow definition 3.137), as well as the physical transmission medium, i.e. electrical or optical.
Initiator	Communication
Further	According to the FlexRay Protocol Specification, the two possible Channels of a
Explanations	FlexRay Network (\rightarrow definition 3.131) are named "Channel A" and "Channel B".
Comment	Synonym: "FlexRay Communication Channel"
Example	
Reference	[FR_PROTOCOL]

3.120 FlexRay Cluster

Definition	A communication system of multiple Nodes (\rightarrow definition 3.132) connected directly (Bus topology) or by Star Couplers (Star topology) (\rightarrow definition 3.137) via a Communication Network consisting of at least one Communication Channel.
Initiator	Communication
Further	The term "FlexRay Cluster" is not to be confused with the term "FlexRay Bus" (\rightarrow
Explanations	definition 3.117) which describes a communication system topology. A FlexRay Cluster consists of a FlexRay Network (\rightarrow definition 3.131) and several FlexRay Nodes.
Comment	
Example	
Reference	[FR_PROTOCOL]

3.121 FlexRay Cycle

Definition	One complete instance of the communication structure that is periodically							
	repeated to comprise the media access method of the FlexRay system. The							
	Communication Cycle consists of a Static Segment, an optional Dynamic							
	Segment, an optional Symbol Window, and a Network Idle Time.							
	The FlexRay Cycles are unequivocally numbered by the FlexRay Cycle Number $(\rightarrow \text{ definition } 3.122)$ ranging from 0 to 63.							
	Even if a FlexRay Network (\rightarrow definition 3.131) consists of two Channels, the							
	FlexRay Cycle is always a common quantity of both Channels, irrespective of the data transmission schedule possibly being different for the two Channels.

3.130 FlexRay Matrix

Definition	A two-dimensional array with a width of the number of FlexRay Slots (\rightarrow definition 3.134) within one FlexRay Cycle (\rightarrow definition 3.121) and a height of 64 FlexRay
	Cycles, numbered 0 63. (See also graphics below.)
	This array is being used to describe the (possible) transmission time intervals on a
	FlexRay Channel (\rightarrow definition 3.119).
	If a FlexRay Network (\rightarrow definition 3.131) consists of two Channels, there is one
	FlexRay Matrix per Channel (resulting in a total of two Matrixes), since the data
	transmission schedule may be different for the two FlexRay Channels.
Initiator	Communication

3.131 FlexRay Network

Definition	The combination of the (up to two) FlexRay Communication Channels that connect the FlexRay Nodes (\rightarrow definition 3.132) of a FlexRay Cluster (\rightarrow definition 3.120).	
Initiator	Communication	
Further	The term "FlexRay Network" is not to be confused with the term "FlexRay Cluster"	
Explanations	or "FlexRay Bus" (→ definition 3.117).	
Comment	Synonym: "FlexRay Communication Network"	
Example		
Reference	[FR_PROTOCOL]	

3.132 FlexRay Node

Definition	A logical entity connected to the FlexRay Network (\rightarrow definition 3.131) that is capable of sending and/or receiving frames.
Initiator	Communication
Further	
Explanations	
Comment	
Example	
Reference	[FR_PROTOCOL]

3.133 FlexRay Physical Communication Link

An inter-Node (\rightarrow definition 3.132) connection through which signals are conveyed for the purpose of communication. All Nodes connected to a given Physical Communication Link share the same electrical or optical signals (i.e., they are not
Communication Link share the same electrical of optical signals (i.e., they are not

	connected through repeaters, Stars (\rightarrow definition 3.137), gateways, etc.). Examples of a Physical Communication Link include a Bus (\rightarrow definition 3.117) Network or a point-to-point connection between a Node and a Star. A Communication Channel may be constructed by combining one or more Physical Communication Links together using Stars.
Initiator	Communication
Further	
Explanations	
Comment	
Example	
Reference	[FR_PROTOCOL]

3.134 FlexRay Slot

Definition	An interval of time during which access to a Communication Channel is granted exclusively (at least in the static segment) to a specific Node (\rightarrow definition 3.132) for the transmission of a Frame (\rightarrow definition 3.125) with a frame ID corresponding to the Slot Number (\rightarrow definition 3.136) of that Slot. FlexRay distinguishes between Static Communication Slots and Dynamic Communication Slots. The FlexRay Slots are unequivocally numbered by the FlexRay Slot Number ranging from 1 to a configurable maximum number \leq 2047. If a FlexRay Network (\rightarrow definition 3.131) consists of two Channels (\rightarrow definition 3.119), the Static Slots of "Channel A" and the Static Slots of "Channel B" occur concurrently, since all Static FlexRay Slots have the same length irrespective of
	the data transmission schedule. However, the Dynamic Slots of "Channel A" are independent from the Dynamic Slots of "Channel B", since the data transmission schedule may be different for the two FlexRay Channels.
Initiator	Communication
Further Explanations	In the dynamic segment, Slot Multiplexing between multiple Nodes is allowed. In the static segment each Slot (\rightarrow definition 3.134) on a Channel is owned by exactly one Node (i.e., Slot Multiplexing is not allowed in the static segment). Slot Multiplexing (i.e., different FlexRay Nodes owning a Slot in different Cycles (\rightarrow definition3.121) for data transmission) is allowed in the dynamic segment, and it is up to the application to ensure that in any given Cycle no two Nodes transmit in the same Slot on the same Channel.
Comment	Synonym: "FlexRay Communication Slot"
Example	
Reference	[FR_PROTOCOL]

3.135 FlexRay Slot Multiplexing

Definition	A method used to fill a FlexRay Slot (\rightarrow definition 3.134) on a Channel (\rightarrow definition 3.119) more efficiently by alternating the Frames being sent in this Slot from Cycle (\rightarrow definition 3.121) to Cycle. In order to achieve periodic transmission of FlexRay Frames (\rightarrow definition 3.125) in a given FlexRay Slot, the Cycle Numbers (\rightarrow definition 3.122) of the FlexRay Cells (\rightarrow definition 3.118) being used for transmission have to fulfill the equation: Cycle Number = (B + n * 2 ^R) _{mod64} Where:			
	 Base Cycle B = 0 63 Cycle Repetition 2^R = 2⁰ 2⁶ = 1, 2, 4, 8, 64 Variable n = 0 64 B < 2^R In the static segment, each Slot on a Channel is owned by exactly one Node (→ 			

	amongst s different N Multiplexir In the dyna of a FlexR the same of Identifier (Multiplexir In any cas different N (See also	definition 3.132). Therefore, in the static segment Slot Multiplexing is only allowed amongst semantically different Frames sent by the same Node, but not amongst different Nodes of a FlexRay Cluster (→ definition 3.120). Thus, this form of Multiplexing is called " Single Sender Slot Multiplexing ". In the dynamic segment, Slot Multiplexing is also allowed amongst different Nodes of a FlexRay Cluster, i.e. different Nodes may send in the same dynamic Slot on the same Channel in different Cycles, hence with different FlexRay L-PDU- Identifier (→ definition 3.128) defining disjunctive FlexRay Cells. Thus, this form of Multiplexing is called " Multiple Sender Slot Multiplexing ". In any case, it is up to the software to prevent concurrent sending attempts (of different Nodes or applications) in the same Cell. (See also graphics below.)

Example	ECU, Software Component,
Reference	[ISO 2382-1]

3.147 Functionality

Definition	Functionality comprises User-visible and User-non-visible functional aspects of a
	system.
Initiator	Software and Architecture
Further	
Explanations	
Comment	EAST glossary not applicable, due to use of function.
Example	Functionality of a communication system is a user-non-visible aspect.
Reference	

3.148 Gateway

Definition	A gateway is functionality within an ECU that performs a frame or signal mapping function between two communication systems. Communication system in this context means e.g. a CAN system or one channel of a FlexRay system.
Initiator	Communication
Further	
Explanations	
Comment	
Example	
Reference	Gateway ECU 0

3.149 Gateway ECU

Definition	A gateway ECU is an ECU (\rightarrow definition 3.90) that is connected to two or more communication channels, and performs gateway functionality.
Initiator	Communication
Further	
Explanations	
Comment	
Example	
Reference	Gateway 3.148

3.150 Graceful Degradation

Definition	Graceful Degradation: The system continues to operate in the presence of errors, accepting a partial degradation of functionality or performance during recovery or repair. Found in the literature also as "fail soft".
Initiator	Safety
Further	

Explanations	
Comment	Safety means are not regarded as a part of the normal functionality respectively
	operation. Also known as: Fail-reduced, Fail-soft
Example	"Limp home" functionality for ECU (reduce torque to assure an arrival at home or
	service station)
Reference	See also: ISO 26262:DIS Part 1: 3.181 - warning and degradation strategy.

3.151 Hardware Connection

Definition	HW Connections are used to describe the connection of HW elements (\rightarrow definition 3.152) among each other. It defines/characterizes the interrelationship among HW Elements (for abstract modelling). The HW Ports (\rightarrow definition 3.154) of the HW Elements serve as connection points for this purpose.
Initiator	General
Further	In AUTOSAR are 2 kinds of HW Connections defined:
Explanations	Assembly HW Connection
	Delegation HW Connection
Comment	
Example	
Reference	[AUTOSAR Specfication of ECU Resource Template]

3.152 Hardware Element

Definition	The HW Element is the main describing element of an ECU (\rightarrow definition 3.90). It provides HW ports (\rightarrow definition 3.154) for being interconnected among each others. A generic HW Element specifies definitions valid for all specific HW Elements.
Initiator	General
Further	A HW Element is the piece or a part of the piece to be described with the ECU
Explanations	Resource Template. It uses other elements as primitive: This means HW elements can be nested (trough HW Containers, a hierarchical structur of HW Elements). At the lowest level a HW Element only uses promitives
Comment	
Example	
Reference	[AUTOSAR Specification of ECU Resource Template]

3.153 Hardware Interrupt

Definition	Interrupt triggered by HW event
Initiator	Software and Architecture
Further	2 sorts of HW events
Explanations	 Processor-intern: events as for example division by zero, arithmetical overflow, non-implemented instruction Processor-extern: events as for example response of peripheral device (e.g. PWM), memory error, timer
Comment	
Example	
Reference	Translation/Adaptation from [VDI Lexikon]

3.154 Hardware Port

Definition The HW port exposes functionality to the exterior of the HW element (→ definition

	3.152). HW elements can be connected via HW Connections (\rightarrow definition 3.150). It defines a connection Endpoint for the HW Element.
Initiator	Communication
Further	HW elements provide HW ports for being interconnected among each others.
Explanations	Each HW port has a name which is unique within the HW element it is located in.
Comment	
Example	
Reference	[AUTOSAR Specification of ECU Resource Template]

3.155 Hook

Definition	An intervention point within ECU software for the exchange of data.
Initiator	Runtime Environment
Further	
Explanations	
Comment	
Example	Hooks used to read ECU variables and/ or overwrite ECU variables with values
	generated by RP (\rightarrow definition 3.225) algorithm.
Reference	

3.156 Host ECU

Definition	A Host ECU is a ECU that controls one or more automotive Ethernet switches (e.g. switch on / off the Ethernet switch and its ports, read and write the Ethernet switch configuration). For this purpose the host ECU is connected to the Ethernet switch over a common control interface (e.g. SPI, MDIO). The host ecu also take part in the network communication. For this purpose the host ecu is connected by a data interface (e.g. MII) to a specific Ethernet switch port (host port). It transmits and receives Ethernet frames.
Initiator	Communication
Further	
Explanations	
Comment	
Example	
Reference	

3.157 Host Port

Definition	A host port is a port of an automotive Ethernet switch where the data interface (e.g. MII) of the Host ECU (\rightarrow definition 3.156) is connected to. The host port could either be an internal port or an external port. The host port has a special role from the perspective of the software. (see link accumulation and port groups)
Initiator	Communication
Further	
Explanations	
Comment	
Example

3.158 Hypervisor

Definition Low-level software that provides and manages several virtual machines in one

	physical machine. Maybe an independent software or contained as an OS functionality.
Initiator	Execution Management
Further Explanations	Shared physical resources are either exclusively assigned to single virtual machine, or accessed through virtual device which is managed by Hypervisor. Various hardware and software mechanisms can support the efficient
	implementation of virtual devices.
Comment	
Example	
Reference	

3.159 Implementation Conformance Class 1 (ICC1)

-	An ICC1 cluster offers a software-component interface (SW-CI) (\rightarrow definition 3.273) and/ or an AUTOSAR network interface (NWI) (\rightarrow definition 3.196). The SW-CI and NWI of an ICC1 cluster provide the functional behavior as specified in the AUTOSAR specifications on ICC3 level.
	Software and Architecture
Explanations	In an ICC1 cluster the basic software is regarded as a black box. It allows legacy platforms to migrate to AUTOSAR: - to be integrated into an AUTOSAR network - to support SW-Cs (→ definition 3.271). The features of an ICC1 cluster can be a subset of the ICC3 features (e.g. FlexRay not used). This has to be indicated in the Implementation Conformance Statement (ICS). The functionality represented in AUTOSAR by the RTE must be a part of any ICC1 cluster that provides an SW-CI. Typically an ICC1 cluster - is not structured into Basic Software (BSW) modules (ICC3) or BSW module
	clusters (ICC2) - has a proprietary internal structure and might consist of legacy/proprietary or highly optimized code. An ICC1 cluster shall provide an interface to the boot loader. ICC1 shall support SW-C compatible configuration for SW-CI and AUTOSAR Network compatible Configuration for NWI.
Comment	Up to Release 4.0 the boot loader architecture is not standardized in AUTOSAR. Therefore the term ICC1 is not applicable to the boot loader architecture itself.
Example	

3.160 Implementation Conformance Class 2 (ICC2)

Definition	ICC2 clusters logically related ICC3 Basic Software (BSW) modules (2 N modules). The number of Cluster Features in an ICC2 cluster is a subset of the union of the number of features of the clustered ICC3 modules.
Initiator	Software and Architecture
Further Explanations	Each ICC2 cluster presents a subset of the clustered ICC3 module's interfaces. ICC2 cluster provides the functional behavior as specified in the AUTOSAR specifications on ICC3 level. ICC2 cluster have a proprietary internal structure and might consist of proprietary

	or highly optimized code.
	ICC2 shall support AUTOSAR ECU Configuration description as an input for the Cluster Configuration It shall be possible to combine ICC2 Clusters and ICC3 Modules in a BSW Architecture. Application interface Conformance (above RTE, software-component interface,
	SW-CI (\rightarrow definition 3.273)) and Bus Conformance (AUTOSAR network interface, NWI (\rightarrow definition 3.196)) must be testable for a BSW which contain one or more ICC2 clusters.
Comment	
Example	Example of a ICC2 Cluster ICC2 Cluster Y ⊆ (ICC3 Module A U ICC3 Module B U ICC3 Module C U ICC3 Module D)
	↑a ↑ b
	Module A e Module B
	∫f ∫h
	Module C Module D
	\longleftrightarrow
	External Interfaces relevant for ICC2 clustering, subset of ICC3 interfaces to other BSW modules or clusters.
	\longleftrightarrow
	Internal Interfaces not relevant for ICC2 clustering (can be proprietary).
Reference	

3.161 Implementation Conformance Class 3 (ICC3)

Definition	For ICC3 the AUTOSAR BSW consists of BSW modules as defined in the Basic Software Module List, including the RTE. ICC3 is the highest level of granularity.
Initiator	Software and Architecture
Further Explanations	All Basic Software modules as defined in the BSW module list including the RTE, must comply with the defined interfaces and functionality as specified in their respective Software specification document (SWS).

3.169 Interrupt Frames

Definition	An interrupt frame is the code which handles the entering/leaving of (C written) interrupt service routines. This code is microcontroller specific and often written in assembly language. Interrupt frames are typically generated by the OS generation tool.
Initiator	Software and Architecture
Further	
Explanations	
Comment	
Example	
Reference	[AUTOSAR_InterruptHandling_Explanation.doc]

3.170 Interrupt Handler

Definition	In the case of a Category 2 interrupt, the ISR is synonymous with Interrupt Handler. In the case of Category 1 interrupt the Interrupt Handler is the function called by the hardware interrupt vector. In both cases the Interrupt handler is the user code that is normally a part of the BSW module. So the Interrupt Handler is a user level piece of code.
Initiator	Software and Architecture

Further	
Explanations	
Comment	
Example	
Reference	[AUTOSAR_InterruptHandling_Explanation.doc]

3.171 Interrupt Service Routine

Definition	A software routine called in case of an interrupt (\rightarrow definition 3.168)
Initiator	Software and Architecture
Further	ISRs have normally higher priority than normal processes and can only be
Explanations	suspended by another ISR which presents a higher priority than the one running.
Comment	
Example	
Reference	[VDI Lexikon]

3.172 Interrupt Vector Table

Definition	An interrupt vector table is a table of interrupt vectors that associates the interrupt service routines (\rightarrow definition 3.171) with the corresponding interrupt request (typically by an array of jumps or similar mechanisms).
Initiator	Software and Architecture
Further	
Explanations	
Comment	
Example	
Reference	

3.173 Interrupt

Definition	Event that enforces the processor to change its state. This interruption causes the normal sequence of instructions to be stopped. Once an interrupt occurred, the running software entity is suspended and an interrupt service routine (\rightarrow definition 0) (the one dedicated to this interrupt) is called.
Initiator	Software and Architecture
Further	Two sorts of interrupts exists: HW and SW interrupts (\rightarrow definition 3.153 and
Explanations	definition 3.275)
Comment	
Example	
Reference	Translation/Adaptation from [VDI Lexikon]

3.174 Invalid Flag

Definition	For a signal in a PDU an optional invalid flag can be added to the PDU payload layout. This flag indicates the validity of other signals in the payload. In case the invalid flag of a signal is set to true in a PDU instance, the respective signal in the payload of the PDU instance does not contain a valid signal value.
Initiator	Communication
Further	This mechanism may be used in gateways to indicate that parts of a PDU do not
Explanations	contain valid data.
Comment	
Example	

Δυτ⊘sΔr

Reference

3.175 Invalid Value of Signal

Definition	For a signal in a PDU an optional invalid value can be defined.
Initiator	Communication
Further	The invalid value is element of the signal value range that can be represented and
Explanations	transported by the signal. The invalid value is the value that is used in all situations where the receiver should be notified that the value in a signal is not valid.
Comment	
Example	In case a PDU for a destination network of a gateway is composed from two PDUs of two different source networks, the failure to receive one PDU can be indicated as invalid values in the respective signals of the transmitted PDU in the destination network.
Reference	

3.176 I-PDU

Definition	Interaction Layer Protocol Data Unit Collection of messages for transfer between nodes in a network. At the sending node the Interaction Layer (<i>IL</i>) is responsible for packing messages into an I-PDU and then sending it to the Data Link Layer (<i>DLL</i>) for transmission. At the receiving node the DLL passes each I-PDU to the IL which then unpacks the messages sending their contents to the application.
Initiator	Communication
Further	
Explanations	
Comment	
Example	ISO 17356-4 specifies an Interaction Layer and works on I-PDUs
Reference	[ISO 17356, Glossary]

3.177 Life Cycle

Definition	The course of development/evolutionary stages of a model element during its life time.
Initiator	Methodology and Templates
Further Explanations	A life cycle consists of a set of life cycle states. A life cycle state can be attached to an element in parallel to its version information. A typical life cycle is {valid, obsolete} and means that a valid element is up to date when first introduced but is substituted later by a new one and therefore gets the life cycle state "obsolete".
Comment	
Example	
Reference	

3.178 Link State Accumulation

Definition	The link state of a certain switch port group is accumulated by embracing the link state of each port that is part of the port group. The rule how to embracing the link state is specified in the Ethernet Interface.
Initiator	Communication

Further	
Explanations	
Comment	
Example	
Reference	

3.179 Link Time Configuration

Definition	The configuration of the SW module is done during link time.
Initiator	Methodology and Templates
Further	The object code of the SW modules receives parts of its configuration from
Explanations	another object code file or it is defined by linker options.
Comment	
Example	Initial value of a signal.
Reference	

3.180 Machine

Definition	A Machine consists of a set of computing resources – such as CPU cores, memory or peripheral (e.g. communication) devices – and has the ability to execute software applications.
Initiator	Execution Management
Further	Computing resources can exist either physically or virtually. A Machine may have
Explanations	physical access to its resources or may run in a virtualized environment.
Comment	
Example	
Reference	

3.181 Manifest

Definition	A Manifest represents a piece of AUTOSAR model description that is created to support the configuration of an AUTOSAR Adaptive Platform product and which is uploaded to the AUTOSAR Pdaptive Platform product, potentially in combination with other artifacts (like binary files) that contain executable code to which the Manifest applies.
Initiator	Methodology and Templates
Further	Manifests are often used to denote a piece of configuration content that ships
Explanations	along a given piece of software and is used to deploy the software in the field.
	There are several kinds of manifest:
	 Application Manifest
	 Machine Manifest
Comment	The Manifest may contain platform implementation dependent data, as well as generic data derived from Application System Description.
Example	
Reference	

3.182 Mapping

	Mapping designates the distribution of elements in the logical view to elements in the physical view.
Initiator	Software and Architecture

Further	In general several entities may be allocated to one container but an entity may be
Explanations	allocated to only one container.
Comment	
Example	 a) Mapping of AUTOSAR Signals onto Frames (for inter-ECU communication). b) Mapping of SW-C onto ECUs (Distribution of the SW-Components to the ECUs).
Reference	

3.183 Master Switch

Definition	A Master Switch is an Ethernet switch where the host port is located.
Initiator	Communication
Further	
Explanations	
Comment	
Example	
Reference	

3.184 MCAL Signal

Definition	The MCAL signal is the software representation of the conditioned signal (\rightarrow definition 3.66). It is provided by the microcontroller abstraction layer (MCAL) and is further processed by the ECU abstraction.
Initiator	General
Further Explanations	The processing unit is accessing the Conditioned Signal through some peripheral device that typically digitises the Conditioned Signal into a software representation. The transformation from the Conditioned Signal to the MCAL Signal has to take the digitalization error into account in order to provide information about the quality loss between the Technical Signal and the MCAL Signal.
Comment	
Example	
Reference	

3.185 Meta Model

Definition	A Model of a Model, in other words a Model on M2.
Initiator	Methodology and Templates
Further	
Explanations	
Comment	
Example	The AUTOSAR Meta Model is an UML2.0 model that defines the language for describing AUTOSAR systems. It is a graphical representation of a template. UML2.0 class diagrams are used to describe the attributes and their interrelationships. Stereotypes and OCL (object constraint language) are used for defining specific semantics and constraints.
Reference	

3.186 Metadata

Definition	Metadata is data about data
Initiator	Methodology and Templates

Further	Metadata includes pertinent information about data, including information about
Explanations	the authorship, versioning, access-rights, timestamps etc
Comment	
Example	
Reference	

3.187 MetaDataLength

Definition	Number of bytes of MetaData (\rightarrow definition 3.186) of a PDU.
Initiator	Communication
Further	The MetaDataLength defines the number of bytes at the end of the PDU (\rightarrow
Explanations	definition 3.204) data which are not actual PDU payload but MetaData.
Comment	
Example	When MetaDataLength is set to 2, the PDU size will increase by 2, and 2 bytes of
	MetaData are appended to the PDU data.
Reference	

3.188 Microcontroller

Definition	Hardware element that integrates computing and communication resources as well as peripheral circuits in a single chip, including memories.
Initiator	General
Further Explanations	Microcontrollers are normally designed for small embedded systems and allow hardware designs with minimal amount of external parts. Microcontroller designs are normally optimized for silicon area and often support hard real-time and high-integrity demands.
Comment	Classic AUTOSAR is intended for Microcontroller based embedded systems.
Example	
Reference	

3.189 Microcontroller Abstraction Layer

Definition	Software layer containing drivers to enable the access of onchip peripheral
	devices of a microcontroller and offchip memory mapped peripheral devices by a
	defined API (\rightarrow definition 3.8).
	Task: make higher software layers independent of the microcontroller.
Initiator	Software and Architecture
Further	The Microcontroller Abstraction Layer is the lowest software layer of the Basic
Explanations	Software.
-	The Microcontroller Abstraction Layer consists of the following parts:
	I/O Drivers
	Communication Drivers
	Memory Drivers
	Crypto Drivers
	Microcontroller Drivers
	Properties:
	 Implementation: µC dependent
	 Upper Interface (API): standardizable and µC independent
Comment	
Example	Examples of drivers located in the Microcontroller Abstraction Layer are:
	onchip eeprom driver
	onchip adc driver
	offchip flash driver

3.191 Mode

Definition	A Mode is a certain set of states of the various state machines that are running in the vehicle that are relevant to a particular entity, e.g. a SW-C, a BSW module, an application or a whole vehicle. In its lifetime, an entity changes between a set of mutually exclusive Modes. These changes are triggered by environmental data, e.g. signal reception, operation invocation.
Initiator	Runtime Environment

3.192 Model

Definition	An M1 - Model, it is an instance of the Meta Model
Initiator	Methodology and Templates
Further	
Explanations	
Comment	
Example	An AUTOSAR Model is an instance of the AUTOSAR Meta Model (→ definition 3.185). The information contained in the AUTOSAR Model can be anything that is representable according to the AUTOSAR Meta Model. The AUTOSAR Model can be stored in many different ways: it might be a set of files in a file system, an XML stream, a database or memory used by some running software tools, etc.
Reference	

3.193 Multimedia Stream

Definition	A consistent sequence of digital data versus time which is suited as input for devices which transfer these data into a continuous visible or audible impression to humans. When transferred over a physical link, multimedia stream data typically are produced at the same rate (by the data source), as they are consumed (by the data sinks).
Initiator	General
Further	A multimedia stream usually follows a certain standard (e.g. MPEG-x).
Explanations	When transferred over a physical link, a multimedia stream needs a certain minimum bandwidth (in terms of bits/second) in order to allow continuous impressions.
	A multimedia stream in a car typically exists for several seconds (a warning signal,
75 of 111	Document ID 055: AUTOSAR_TR_Glossary

	a navigation hint) up to several hours (a video film, a phone call, playing a radio program). Resources (e.g. bus system channels) needed by the stream have to be allocated continuously over this lifetime (this is a difference to e.g. file transfer, which may be split into several chunks of data). The source of a multimedia stream typically is a specialized device and/or software program (a tuner, a microphone, a text-to-speech engine, etc.). The same holds for the sinks (an audio amplifier or mixer, a voice recognition software, an MPEG decoder, etc.).
Comment	The term "visible or audible impression to humans" should not be taken too
	literally, because streams can also be used to transfer machine readable data (e.g. modem, encrypted signals). But it is this condition, which defines the
	standards and technology used in multimedia streams.
Example	Audio stream as output of or input to a telephone (mono, low bandwidth)
-	Audio stream as output of a radio tuner (stereo, high bandwidth)
	Video stream as output of a television tuner
	An example for the physical implementation on a multimedia bus is the Firewire
	isochronous stream. see reference
Reference	[IEEE 1394]

3.194 Multiple Configuration Sets

Definition	A SW module has more than one alternative configuration (parameter) set, which can be selected according to external requirements. The set can ONLY be selected during start-up and it is not allowed to switch the set during runtime.
Initiator	Methodology and Templates
Further	Multiple configuration sets reside in the ECU non-volatile memory at the same
Explanations	time, the active configuration is selected at the start-up of the ECU. Only BSW
	modules can have multiple configuration sets
Comment	Multiple configuration is a kind of data variant coding
Example	The same ECU can be used for the left and the right window lifter, the actual pin
	setting determines which configuration set will be used.
Reference	

3.195 Multiplexed PDU

Definition	A multiplexed PDU is a PDU with a configurable number of different payload layouts.
Initiator	Communication
Further Explanations	Each instance of a multiplexed PDU has a distinct layout. The set of possible layouts is statically defined. A selector signal defines which layout is used in a PDU instance. The selector signal must reside at the same position in all layouts. Each layout is identified by a unique selector value. The length of each instance of a multiplexed PDU is fixed.
Comment	
Example	
Reference	

3.196 Network Interface

Definition	A Network Interface is the sum of all interfaces offered by the Basic Software (\rightarrow definition 3.38) towards its connected network.
Initiator	Communication
Further	The interface that the Basic Software shares via the communication lines with
Explanations	other systems that behave like AUTOSAR ECUs in order to

	- allow distributed SW-Cs (\rightarrow definition 3.271) to exchange inter-ECU signals and
	to - operate the communication lines (the network) is called Network Interface.
	A Network Interface (NWI) denotes the interface between the Basic Software and the physical network (OSI Layer 0) to which the ECU executing the Basic Software is connected to (e.g. CAN, LIN, FlexRay). The NWI therefore transports network data packets between the Basic Software and the physical network.
	The interfaces included within the term NWI are: - Logical interfaces, including
	Note that, attention must be given to the physical form of the network, since it is not formally specified by AUTOSAR. The NWI provided by a given ECU supports the transfer of data to and from the ECU, and management of the network. For the purposes of this definition, the Basic Software can be designed according to ICC1, ICC2 or ICC3.
Comment	The term has been introduced as a short-hand to aid in discussion of the conformance of the content of ICC1 / 2 and to define the backward compatibility between releases and revisions. However, since from the network perspective, the clustering of the Basic Software is invisible, the Network Interface is applicable to all potential Basic Software conformance classes (ICC1, ICC2, ICC3) in the same way.
Example	
Reference	Software Component Interface (SW-CI)

3.197 NM Coordination Cluster

A discrete set of NM Channels on which shutdown is coordinated.
Communication
The NM Coordinator will keep all presently awake NM Channels of an NM
Coordination Cluster awake until it is possible to coordinate network sleep on all
the awake channels.
AUTOSAR Generic NM Interface

3.198 NM Coordinator

Definition	A functionality of the Generic NM Interface which allows coordination of network sleep for multiple NM Channels.
Initiator	Communication
Further	Depending on configuration, different level of synchronous network sleep can be
Explanations	achieved. The NM Coordinator is using a generic coordination algorithm which, by means of individually configured timeout and synchronization indications can coordinate a synchronized shutdown of multiple NM Channels.
Comment	
Example	

Δυτ⊘sΔr

3.199 Notification

Definition	Informing a software entity about a state change of a hardware and/or software entity which has occurred.
Initiator	Software and Architecture
Further	The informing about a state change can be done by an activation of a software
Explanations	part or by setting a flag (\rightarrow definition 3.115).
Comment	
Example	
Reference	

3.200 OS Application

Definition	A block of software including tasks, interrupts, hooks and user services that form a cohesive functional unit.
Initiator	Software and Architecture
Further	Trusted:
Explanations	An OS-Application that may be executed in privileged mode and may have unrestricted access to the API and hardware resources. Only trusted applications can provide trusted functions. Non-trusted: An OS-Application that is executed in non-privileged mode has restricted access to the API and hardware resources.
Comment	The trusted / non-trusted attribute of an OS-Application is not related to ASIL/non-ASIL.
Example	
Reference	[AUTOSAR Specification of OS]

3.201 OS Event

Definition	 The event mechanism is a means of synchronization is only provided for extended tasks initiates state transitions of tasks to and from the waiting state.
Initiator	Software and Architecture

3.205 PDU MetaData

Definition	Additional data of a PDU (\rightarrow definition 3.204), which is not part of the payload.
Initiator	Communication
Further	MetaData (\rightarrow definition 3.186) is placed behind the PDU payload in the PDU
Explanations	buffers. The size of the MetaData is determined by the MetaDataLength (\rightarrow
	definition 3.187).
Comment	MetaData was introduced to transport parts of the CAN ID or addressing
	information alongside the data of a PDU.
Example	Diagnostics according to ISO 15765/14229, J1939 parameter group handling.
Reference	

3.206 PDU Timeout

Definition	Maximum time between the receptions of two instances of one PDU is exceeded.
Initiator	Communication
Further Explanations	This timeout indicates that the last reception of a PDU instance is too long in the past. As a consequence it can be concluded that the data in the last PDU instance is outdated.
Comment	
Example	
Reference	

3.207 Performance

Definition	Performance is a set of measurable characteristics (e.g. time, memory, resources usage, power consumption, etc.) which may be used to compare different system, SW element, algorithm, etc. implementations.
Initiator	Safety
Further Explanations	Scalability refers to the characteristic of a system to increase performance by adding additional resources. If the software performance requirements change (e.g more functions that impact the response time), scalability comes into play. Scalability is the ability of a system to continue to meet its response time or throughput objectives as the demand for the software functions increases.
Comment	
Example

3.209 Personalization

Definition	User-specific and memorized adjustment of SW data or selection of functional alternatives.
Initiator	Software and Architecture
Further	
Explanations	
Comment	
Example	Seat parameters (position, activation status of drive-dynamic seat) can be stored in correlation to a user ID. For a given user ID the seat can be adjusted according to the stored position parameters and the drive-dynamic seat can be activated or deactivated.
Reference	

3.210 Plausibility

Definition	Runtime Plausibility check is a method to verify during runtime if inputs for a computation/algorithm or results of a computation/algorithm are reasonable against corresponding values of a simplified reference model.
Initiator	Safety
Further Explanations	Range checks are a subset of plausibility checks. The additional knowledge can be taken from various sources, e.g. the physical domain of the value or from a model representing the computation/algorithm more roughly and calculating in parallel to the actual computation/algorithm.
Comment	
Example	 Range Check: for determination that a value for a car velocity is plausible, the knowledge that a normal vehicle cannot be faster than 400km/h. Plausibility: for determination that that a value for a car velocity is plausible, the history of the values can be used and the knowledge that a certain acceleration for a car cannot be exceeded. E.g. velocity was 10 km/h and increases within 1 Sec to 100 km/h.
Reference	

3.211 Port

Definition	A port belongs to a software component (\rightarrow definition 3.271) and is the interaction point between the component and other components. The interaction between specific ports of specific components is modeled using connectors (\rightarrow definition 3.69). A port can either be a p-port (\rightarrow definition 3.223) or an r-port (\rightarrow definition 3.234).
Initiator	Software and Architecture
Further	
Explanations	
Comment	For more information see AUTOSAR Specification of VFB
Example	
Reference	[AUTOSAR Specification of Virtual Functional Bus]

3.212 Port Interface

Definition	A Port Interface characterizes the information provided or required by a port (\rightarrow definition 3.210) of a software component (\rightarrow definition 3.271).
Initiator	Software and Architecture
Further	A Port Interface is either a Client-Server Interface (\rightarrow definition 3.57) in case
Explanations	client-server communication (\rightarrow definition 3.56) is chosen or a sender-receiver

	Interface (\rightarrow definition 3.258) in case sender-receiver communication (\rightarrow definition 3.257) is used.
Comment	For more information see: AUTOSAR Specification of VFB
Example	
Reference	[AUTOSAR Specification of Virtual Functional Bus]

3.213 Post-build Hooking

Definition	The insertion of Hooks (\rightarrow definition 3.155) to facilitate Rapid Prototyping (\rightarrow definition 3.225) support into a (complete) ECU hex image.
Initiator	Runtime Environment
Further	
Explanations	
Comment	
Example	Detection of reads and/or writes of ECU variables by analysis of the instruction
	stream.
Reference	

3.214 Post-build Time Configuration

Definition	The configuration of the SW module is possible after building the SW module.
Initiator	Methodology and Templates
Further	The SW may receive its configuration file that can be downloaded to the ECU
Explanations	separately, avoiding a re-compilation and re-build of the ECU SW modules. In order to make the post-build time re-configuration possible, the re-configurable elements shall be stored at a known position in the ECU storage area
Comment	
Example	Identifiers of the CAN frames
Reference	

3.215 Pre-build Hooking

Definition	The insertion of Hooks (\rightarrow definition 3.155) to facilitate Rapid Prototyping (\rightarrow definition 3.225) support into software source prior to creating an ECU hex image.
Initiator	Runtime Environment
Further	
Explanations	
Comment	
Example	
Reference	

3.216 Pre-Compile Time Configuration

Definition	The configuration of the SW module is done at source code level and will be effective after compile time.
Initiator	Methodology and Templates
Further	The source code contains all the ECU configuration data and when compiled
Explanations	together, it produces the given SW.
Comment	
Example	Preprocessor switch for enabling the development error detection and reporting
Reference	

3.217 Predictabiliy

Definition	Predictability is the degree to which a correct prediction or forecast of a system's state / behavior can be made either qualitatively or quantitatively.
Initiator	Safety
Further Explanations	Important type of predictability occurs in the design of systems that are subject to real-time requirements. A good overview of predictability criteria and how to achieve them can be found in
Comment	
Example	
Reference	John A. Stankovic, Krithi Ramamritham, What is predictability for real-time systems?, Journal of Real-Time Systems, Volume 2 Issue 4, Nov. 1990, 247-254

3.218 Pretended Networking

Definition	Method to reduce energy consumption in an existing active network without changing network infrastructure.

Initiator	Communication
Further	
Explanations	
Comment	
Example	
Reference	

3.219 Private Interface

Definition	A private interface is an interface within the Basic Software (\rightarrow definition 3.38) of AUTOSAR which is neither standardized nor defined within AUTOSAR.
Initiator	Software and Architecture
Further Explanations	The goal of the private interface is to enable a more efficient implementation of basic software modules. Basic software modules sharing a private interface have to be distributed as one package. This package has to behave exactly the same as separate modules would. It must provide the same standardized interfaces to the rest of the basic software and/or RTE as separate modules would. It has to be configured exactly the same as separate modules would be configured.
Comment	Private interfaces contradict the goal of exchangeability of standard software modules and should be avoided.
Example	
Reference	

3.220 Probability of Failure

Definition	Probability of the occurrence of a failure in a system or functional unit.
Initiator	Safety
Further	
Explanations	
Comment	
Example

3.224 Provide Port

Definition	Specific Port (\rightarrow definition 3.210) providing data (\rightarrow definition 3.72) or providing a service of a server (\rightarrow definition 3.260).
Initiator	Software and Architecture
Further	The Provide Port is sometimes abbreviated as PPort or P-Port.
Explanations	
Comment	
Example	Server Port
	Sender Port
Reference	

3.225 Rapid Prototyping

Definition	The experimental incorporation of new functionality.
Initiator	Runtime Environment
Further	Rapid Prototyping (RP) permits a user to quickly perform experiments to add new
Explanations	functionality, or to replace/bypass existing functionality, without requiring an ECU
	image to be built.
Comment	
Example	
Reference	

3.226 Rapid Prototyping Memory Interface

Definition	The memory access pattern necessary for RP tool (\rightarrow definition 3.227).
Initiator	Runtime Environment
Further	The RP memory interface provides the well-defined memory access pattern
Explanations	required by RP tool to ensure consistent and complete access to bypass (\rightarrow
	definition 3.44) values.
Comment	
Example	A mandated "write-read" cycle within RTE APIs provides the RP tool with an opportunity to bypass (i.e. substitute with value generated from an alternative algorithm) the written value before it is read and then subsequently used within the generated code.
Reference	-

3.227 Rapid Prototyping Tool

Definition	Software and/ or hardware tools to support Rapid Prototyping (\rightarrow definition 3.225).
Initiator	Runtime Environment
Further	
Explanations	
Comment	
Example	Dedicated prototyping interfaces on ECUs accessed by PC-based software tools.

3.229 Recovery

Definition	Returning to intended functionality after fault detection without violating the safety
	goals.
Initiator	Safety
Further	 Restart mode: Restart Operation from the initial state of operation
Explanations	 Continue mode: Restart Operation from the last known state of operation
	 Recovery by repetition: repeat until timeout to cope i.e. random transmission errors.
	 Forward error recovery: relies on continue from an erroneous state by making selective corrections to the system state. This includes making the controlled environment safe, which may be damaged because of the failure Backward error recovery: relies on restoring the system to a previous safe state and executing an alternative section of the program. This has the same functionality but uses a different algorithm (c.f. N-Version Programming) Recovery Point: The point to which a process is restored is called a recovery point and the act of establishing it is termed check-pointing (saving appropriate system state) Recovery testing is the forced failure of the software in a variety of ways to verify that recovery is properly performed.

3.230 Redundancy

Definition	 Existence of means in addition to the means that would be sufficient for an element to perform a required function or to represent information. Hardware element redundancy includes replicated or additional hardware means added to the system to support fault tolerance. Software element redundancy includes the additional SW units and/or data used to support fault tolerance.
Initiator	Safety

Further	
Explanations	
Comment	
Example	
Reference	See ISO 26262, Part 1, ID 1.94

3.231 Reentrancy

Definition	In AUTOSAR a Function (→ definition 3.141) is called reentrant if it can be interrupted in the middle of its execution and then safely called again ("re- entered") before its previous invocations complete execution. AUTOSAR differs between • (full) reentrancy • non reentrancy and • conditional reentrancy.
Initiator	Software and Architecture
Further Explanations	Reentrancy is always considered from the viewpoint of the caller. A Function which is conditional reentrant has to document the conditions for the reentrancy. Typical cases for conditional reentrancy are functions which are reentrant as long as a function parameter is different to (possible) ongoing calls.
Comment	An implementation of a Function might be reentrant for one system but only conditional reentrant (or even non reentrant) for another one. It always depend how the reentrancy was realized (e.g. locks). As an example, just consider a function which uses interrupt locks to realize full reentrancy on a single core system. If this implementation is used in a multi core system its reentrancy will only be conditional reentrant for calls from the same core.
Example

3.242 RTE Event

An RTE Event encompasses all possible situations that can trigger execution of a runnable entity (\rightarrow definition 3.243) by the RTE. Thus they can address timing,
data sending and receiving, invoking operations, call server returning, mode

	switching, or external events. RTE Events can either activate a runnable entity or
	wakeup a runnable entity at its waitpoints.
Initiator	Runtime Environment
Further	Note 'event' in this context is not necessarily synonymous with 'RTEEvent' as
Explanations	defined in the VFB specification. In particular, RTE Events that result from
	communication are handled by communication-triggered runnable entities.
Comment	Events can have a variety of sources including time.
Example	Scheduling of runnable entities from angular position, e.g. a crankshaft, that are used to trigger an interrupt and hence an RTE notification. A software component needs to perform a regular interval, e.g. flash an LED, reset a watchdog, etc.
Reference	

3.243 Runnable Entity

Definition	A Runnable Entity is a part of an Atomic Software-Component (\rightarrow definition 3.18) which can be executed and scheduled independently from the other Runnable Entities of this Atomic Software-Component. It is described by a sequence of instructions that can be started by the RTE (definition \rightarrow 3.242). Each runnable entity is associated with exactly one Entry Point (definition \rightarrow 3.92).
Initiator	Software and Architecture
Further	A Runnable Entity contains at least two points for the Scheduler (\rightarrow definition
Explanations	3.254):
	1 Entry Point (\rightarrow definition 3.92) and 1 Exit Point (\rightarrow definition 3.100).
	Due to the reason that an Atomic Software Component is not dividable, all its Runnable Entities are executed on the same ECU.
Comment	In general a task in the runtime system consists out of n Runnable Entities of m
	Atomic Software-Components.
Example	Server function of a Software Component.
Reference	

3.244 SAE J1939

Definition	SAE J1939 is a vehicle bus standard created by the SAE (Society of Automotive Engineers, a USA standards body) for car and heavy duty truck industries.
Initiator	Communication
Further	The J1939 standard encompasses the following areas:
Explanations	- bus physics (J1939/11, J1939/15)
-	- CAN message layout (J1939/21)
	- request/response and multi packet transport protocols (J1939/21)
	- network management used to assign a unique address to each node (J1939/81)
	- diagnostics layer comparable to UDS in complexity (J1939/73)
	- standardized application signals and messages (J1939/71)
Comment	The J1939 standard is used by most truck manufacturers worldwide and is
	prescribed for OBD in some states of the USA. It is also used as a base for other
	standards for maritime (NMEA 2000), agricultural (ISO 11783), and military
	(MilCAN A) applications.

Further	The application may be simplified for better understanding within the evaluation
Explanations	phase.
Comment	
Example	Diagnosis Application
-	Exterior Light Management
Reference	

3.253 Scalability

Definition	The degree to which assets can be adapted to specific target environments for various defined measures.
Initiator	Software and Architecture
Further	
Explanations	
Comment	Target environment introduced compared to EAST-Glossary.
Example	
Reference	[EAST-Glossary]

3.254 Scheduler

Definition	The scheduler handles the scheduling of the tasks/runnable entities (definition \rightarrow 3.294 / 3.243) according to the priority and scheduling policy (pre-defined or configurable). It has the responsibility to decide during run-time when which task can run on on the CPU of the ECU.
Initiator	Software and Architecture

Further Explanations	There are many strategies (priority-based, time-triggered, round-robbin,) a scheduler can use, depending of the selected and/or implemented algorythms
Comment	
Example	
Reference	[AUTOSAR Specification of Virtual Functional Bus]

3.255 Service Data Unit

Definition	Service Data Unit is the data passed by an upper layer, with the request to transmit the data. It is as well the data, which is extracted after reception by the lower layer and passed to the upper layer.
Initiator	Communication
Further	A SDU is part of a PDU (\rightarrow definition 3.204).
Explanations	
Comment	
Example	
Reference	

3.256 Security

Definition	Protection of data, software entities or resources from accidental or malicious
	acts.
Initiator	Software and Architecture
Further	
Explanations	
Comment	Slightly adapted norm.
Example	
Reference	[ISO 2382-8]

3.257 Sender-Receiver Communication

Definition	A communication pattern which offers asyncronous distribution of information where a sender communicates information to one or more receivers, or a receiver receives information from one or several senders.
Initiator	Software and Architecture
Further	The process of sending data does not block the sender and the sender usually
Explanations	gets no response from the receivers
Comment	Often used for data or event distribution
Example	
Reference	[AUTOSAR Specification of Virtual Functional Bus]

3.258 Sender-Receiver Interface

Definition	A sender-receiver interface is a special kind of port-interface (\rightarrow definition 3.212) used for the case of sender-receiver communication (\rightarrow definition 3.257). The sender-receiver interface defines the data-elements which are sent by a sending component (which has a p-port providing the sender-receiver interface) or received by a receiving component (which has an r-port requiring the sender- receiver interface).
Initiator	Software and Architecture
Further Explanations	

Comment	A special kind of Port-Interface
Example	
Reference	[AUTOSAR Specification of Virtual Functional Bus]

3.259 Sensor/Actuator SW-Component

Definition	SW-Component (\rightarrow definition 3.271) dedicated to the control of a sensor or
	actuator.
Initiator	Software and Architecture
Further	There will be several Sensor/ Actuator SW-Cs in each ECU. In general there will
Explanations	be one Sensor/Actuator SW-C for each sensor and one for each actuator (=>
	number of Sensor/Actuator SW-C = number of sensors + number of actuators).
Comment	
Example	
Reference	

3.260 Server

Definition	Software entity which provides services for clients (\rightarrow definition 3.54).
Initiator	Software and Architecture
Further	The server (\rightarrow definition 3.260) and the clients using its service might be located
Explanations	on one ECU or distributed on different calculation units (e.g. ECU).
Comment	Adapted from Balzert.
Example	
Reference	[Balzert99]

3.261 Service

Definition	A service is a type of operation that has a published specification of interface and behavior, involving a contract between the provider of the capability and the potential clients.
Initiator	Software and Architecture
Further	
Explanations	
Comment	
Example	Diagnosis service,
Reference	[EAST-Glossary]

3.262 Service Discovery

Definition	Generic functionality provided by the Communication Management to Applications that allows Applications at runtime to find locally or remotely available Service Instances providing the requested service.
Initiator	Communication
Further Explanations	Based on Application query, the Communication Management provides list of compatible Service Instances. Compatibility is defined by compatibility rules and may consider version or QoS attributes.
Comment	
Example	
Reference	

3.263 Service Instance

Definition	The properties of a service instance are described by a specific service interface. A service instance has a unique identity.
Initiator	Communication
Further Explanations	It is accessible by other Applications by using a Service Requester Proxy at runtime and is typed by a specific Service Interface.
	It is addressable within the vehicle network by its Service Instance ID, an abstraction from of the physical location.
	Optionally, authentication data is associated with a Service Instance for authentication at runtime.
Comment	
Example	
Reference	

3.264 Service Interface

Definition	A service interface is a special kind of port interface (see Port Interface) used in the Adaptive platform. It defines both data elements for event based communication and operations that are provided by the service provider and that can be used by the service requester.
Initiator	Communication
Further	
Explanations	
Comment	
Example	
Reference	

3.265 Service Oriented Communication

Definition	Communication, for which communication partners are generally not defined during design time, but dynamically discovered and bound during runtime.
Initiator	Communication
Further Explanations	Communication partners are generally not defined during design time, but dynamically discovered and bound during runtime. Adaptive AUTOSAR Applications are therefore developed agnostic to the concrete context, assuming model of loosely-coupled components.
Comment	This is the standard communication paradigm for communication between AUTOSAR Adaptive Applications.
Example	
Reference	

3.266 Service Port

Definition	A Service Port is a Port (\rightarrow definition 3.210) of an SW-C (\rightarrow definition 3.271),
	Complex Driver (\rightarrow definition 3.63) and/or ECU Abstraction (\rightarrow definition 3.86)
	connected to an AUTOSAR Service (\rightarrow definition 3.33).
Initiator	Software and Architecture
Further	The interface of a Service Port has to be a Standardized AUTOSAR Interface (\rightarrow
Explanations	definition 3.27 and 3.283).
	A Service Port does not need to be connected to another Port in the VFB View (\rightarrow

	definition 3.310).
Comment	If a service is provided by the ECU where a specific Atomic Software Component is located the VFB View is sufficient. If a service is provided by another ECU the connection of the service call to the service has to be done explicitly during the mapping step.
Example	Write data to non volatile memory.
Reference	

3.267 Service Proxy

Definition	A facade that represents a specific service on code level from the perspective of the service consumer providing methods for all functionalities offered by the represented service.
Initiator	Communication
Further Explanations	The service consumer side Application code interacts with this local facade, which then knows how to propagate these calls to the real service implementation and back. The Service Proxy is typically an instance of a service proxy class which itself is potentially generated from ServiceInterface according to standardized patterns and implemented by platform-specific Communication Management. The Service Proxy provides placeholder for Service Instance ID, which is set at runtime by requesting Application implementation using Service Discovery or statically based on Planned Dynamics.
Comment	
Example	
Reference	

3.268 Service Skeleton

Definition	A representation of a specific service on code level from the perspective of the service implementation, which provides functionalities according to the service definition and allows to connect the service implementation to the Communication Management transport layer, so that the service implementation can be contacted by service consumers.
Initiator	Communication
Further Explanations	The Service Skeleton is typically an instance of a service skeleton class which itself is potentially generated from a ServiceInterface according to standardized patterns and implemented by platform-specific Communication Management. The skeleton provides placeholder for the Service Instance ID, which is set by platform implementation, e.g. based on Application Description at design time, or by the Vehicle Software Configuration Manager at setup.
Comment	
Example	
Reference	

3.269 Services Layer

Definition	The Services Layer is the highest layer of the Basic Software which also applies for its relevance for the application software: while access to I/O signals is covered by the Hardware Abstraction Layer, the Services Layer offers Operating system services Vehicle network communication and management services
------------	--

	Memory services (NVRAM management) Diagnosis Services (including KWP2000 interface and error memory) ECU state management Task: Provide basic services for application and basic software modules
Initiator	
Initiator	Software and Architecture
Further	The Services Layer consists of the following parts:
Explanations	Communication Services
	Memory Services
	System Services
Comment	
Example	Network Management, NVRAM Manager, ECU State Manager

3.272 Software Component

Definition	Software-Components are architectural elements that provide and/or require
	interfaces and are connected to each other through the Virtual Function Bus to fulfill
	architectural responsibilities.
Initiator	Software and Architecture
Further	A Software Component has a formal description defined by the software component
Explanations	template (\rightarrow definition 3.296).
-	Software Components can be abbreviated as SW-Cs.
	SW-Cs may be atomic components, parameter components or compositions.
	Also the software modules providing the Software Component Interface (\rightarrow definition
	3.273) of a Basic Software Module (\rightarrow definition 3.39) are called Software
	Components.
Comment	
Example	
Reference	

3.273 Software Component Interface

Definition	A Costilling Company and Interface (CIVI CIV) is the sum of all interfaces afferred by the
Definition	A SoftWare-Component Interface (SW-CI) is the sum of all interfaces offered by the
	Basic Software (\rightarrow definition 3.38), towards the SW-Cs (\rightarrow definition 3.271).
Initiator	Software and Architecture
Further	A SW-CI denotes the interface between an SW-C and the underlying Basic Software
Explanations	cluster including the RTE. The SW-CI therefore comprises all API (\rightarrow definition 3.8),
	functions (\rightarrow definition 3.141) and Callbacks (\rightarrow definition 3.46) that the SW-C
	requires from and provides to the Basic Software (generally by means of RTE
	mechanisms). It includes also the mechanisms allowing SW-Cs sharing the SW-CI to
	communicate with one another.
	For the purposes of this definition, the Basic Software clustered on an ECU can be
	designed according to ICC1, 2 and 3.
Comment	The term has been introduced as a short-hand to aid in discussion of the conformance of the content of Basic Software clusters of conformance class ICC1 / 2 and to define the backward compatibility between releases and revisions. However, since from the SW-C perspective, the clustering of the Basic Software is invisible, the Component Interface is applicable to all potential Basic Software conformance classes (ICC1, ICC2, ICC3) in the same way.
Example	
Reference	Network Interface (NWI)

3.274 Software Configuration

Definition	The arrangement of software elements in a SW system.
Initiator	Software and Architecture
Further Explanations	A software element is a clearly definable software part. A software configuration is a selection version of software modules, software components, parameters and generator configurations. Calibration and Variant Coding (\rightarrow definition 3.303) can be regarded as subset of Software Configuration.
Comment	
Example	
Reference	[EAST-Glossary]

3.275 Software Interrupt

Definition	Interrupt triggered by SW event.
Initiator	Software and Architecture
Further	SW events are for example calling an operating system service, starting a process
Explanations	with higher priority.
Comment	
Example	
Reference	Translation/Adaptation from [VDI Lexikon]

3.276 Software Package

Definition	Unit for deployment of software onto Adaptive AUTOSAR Platform instances containing zero or more executables and the metadata to install and execute it on the Machine.
Initiator	Software and Architecture
Further	Typically, a software package contains one or more executables however it is
Explanations	permitted to have no executables to enable update of configuration metadata.
98 of 111	Document ID 055: AUTOSAR_TR_Glossary

Comment	
Example	
Reference	Translation/Adaptation from [VDI Lexikon]

3.277 Software Signal

Definition	A Software Signal is an asynchronous event transmitted between one process and another.
Initiator	Software and Architecture
Further	A SW Signal is the software implementation of an (control-) information.
Explanations	Additionally it may have attributes (e.g. freshness, data type,). It is exchanged between SW-Components.
Comment	
Example	
Reference	

3.278 Software Unit

Comment	
Example	
Reference	ISO 26262, Part 1, ID 1.125

3.279 Special Periphery Access

Definition	Special functions to standard peripheral devices or special peripherals.
Initiator	Software and Architecture
Further	Is only used when, because of technical issues, no standard periphery access can
Explanations	be used
Comment	
Example	
Reference	

3.280 Standard Periphery Access

Definition	Standard functions to typical standard peripheral devices that are available on an ECU (most microcontroller integrated) used in automotive embedded applications.
Initiator	Software and Architecture
Further	
Explanations	
Comment	
Example	Digital Input/Output, Analog/Digital Converter, Pulse Width (De)Modulator,
	EEPROM, FLASH, Capture Compare Unit, Watchdog Timer
Reference	

3.281 Standard Software

Definition	Standard Software is software which provides schematic independent infrastructural functionalities on an ECU. It contains only Standardized Interfaces (\rightarrow definition 3.285), Standardized AUTOSAR Interfaces (\rightarrow definition 3.283) and/or Private Interfaces (\rightarrow definition 3.219).
Initiator	Software and Architecture
Further	
Explanations	
Comment	
Example	OSEK (ISO 17356), MCAL, Services
Reference	

3.282 Standardized AUTOSAR Blueprint

Definition	A Standardized AUTOSAR Blueprint is an AUTOSAR Blueprint (→ definition 3.24) standardized within the AUTOSAR project. Its derived objects are considered as being standardized within the AUTOSAR project as well.
Initiator	Application Interfaces
Further Explanations	Blueprints were introduced within the AUTOSAR projects to enable standardization of ports without standardizing the static view of the architecture (i.e. the software components providing or requesting the ports). Sometimes it is not possible to standardize all attributes of an AUTOSAR element because the values of some attributes are project specific. Nevertheless it enables better collaboration if some of the attributes are standardized. Additionally blueprints enable adding descriptions and long names in different languages.
Comment	
Example	
Reference	[MOD AI Specification]

3.283 Standardized AUTOSAR Interface

Definition	This is an AUTOSAR Interface which is standardized within the AUTOSAR project.
Initiator	Software and Architecture
Further	AUTOSAR Services (\rightarrow definition 3.33) interact with other components through a
Explanations	Standardized AUTOSAR Interface.
	AUTOSAR Interfaces can be derived from AUTOSAR Application Interfaces (\rightarrow
	definition 3.21).
Comment	
Example	
Reference	

3.284 Standardized Blueprint

Definition	A Blueprint (\rightarrow definition 3.41) is called a Standardized Blueprint if the derived objects are considered as being standardized as well. It also includes that additionally concrete standardized rules exist how to specify the blueprint as well as how to derive an object from that blueprint. This is typically not done for a specific blueprint but for all blueprints of the same class.
Initiator	Application Interfaces
Further	
Explanations	

Comment	
Example	
Reference	

3.285 Standardized Interface

Definition	A software interface is called Standardized Interface if a concrete standardized API exists.
Initiator	Software and Architecture
Further	Modules in the Basic Software interact which each other through Standardized
Explanations	Interfaces.
Comment	
Example	ISO 17356-4: COM Interface
Reference	

3.286 Static Configuration

Definition	A setup where the routing configuration cannot be changed during normal operation of the gateway.
Initiator	Communication
Further Explanations	Static configuration doesn't allow reconfiguration of the routing during normal operation e.g. during driving. Static configuration does not restrict the update of the configuration in specific maintenance operation modes (e.g. programming mode).
Comment	
Example	A software update may change a routing configuration such that a PDU is routed into two instead of one destination networks.
Reference	

3.287 Synchronize

Definition	To make two or more events or operations to occur at the same predefined moment in time.
Initiator	Communication
Further	
Explanations	
Comment	
Example	Two NM Channels can enter Bus Sleep Mode at the same time ("synchronized network sleep") or they can be ordered to go to sleep at the same time ("synchronized shutdown initiation").
Reference	AUTOSAR Generic NM Interface

3.288 Synchronous Communication

Definition	A communication is synchronous when the calling software entity is blocked until the called operation is evaluated. The calling software entity continues its operation by getting the result.
Initiator	Software and Architecture
Further	Synchronous communication between distributed functional units has to be
Explanations	implemented as remote procedure call.
Comment	Are further mechanisms possible?
Example	

Reference

3.289 Synchronous Function

Definition	A function is called synchronous if the described functionality is guaranteed to be completed the moment the function returns to the caller.
Initiator	Software and Architecture
Further	
Explanations	
Comment	
Example	
Reference	

3.290 System

Definition	An integrated composite that consists of one or more of the processes, hardware, software, facilities and people, that provides a capability to satisfy a stated need or objective.
Initiator	General
Further	
Explanations	
Comment	ITEA EAST uses IEEE 14407 standard. Here not applicable because of problem with the definition of function. One correct interpretation is: - it might be a composition of one or more ECUs
Example	Braking system
Reference	[ISO 12207]

3.291 System Constraint

Definition	Boundary conditions that restrict the Design-Freedom of the (cars E/E-) System.
Initiator	Software and Architecture
Further	The design of ECU Networks and the distribution of functionalities to ECUs are
Explanations	limited by several constrains. These constraints result mostly by the
	communication matrix and safety requirements
Comment	
Example	An existing communication matrix that restricts the distribution of signals to frames is a system constraint. Another system constraint is a safety requirement that does not allow to map a specified Software component to specific ECU.
Reference	

3.292 System Signal

Definition	The system signal represents the communication system's view of data exchanged between SW components which reside on different ECUs. The system signals allow to represent this communication in a flattened structure, with (at least) one system signal defined for each data element sent or received by a SW component instance. If data has to be sent over gateways, there is still only one system signal representing this data. The representation of the data on the individual communication systems is done by the cluster signals.
Initiator	Communication
Further	

Explanations	
Comment	
Example	
Reference	

3.293 Systematic Fault

Definition	See ISO 26262, Part 1, ID 1.131
Initiator	Safety
Further	
Explanations	
Comment	
Example	
Reference	ISO 26262, Part 1, ID 1.131

3.294 Task

Definition	A Task is the smallest schedulable unit managed by the OS. The OS decides when which task can run on the CPU of the ECU.
Initiator	Software and Architecture
Further	A runnable entity (\rightarrow definition 3.243) of a software component runs in the context
Explanations	of a task. Also the Basic Software Modules runs in the context of a task.
Comment	
Example	
Reference	[AUTOSAR Specification of Virtual Functional Bus]

3.295 Technical Signal

Definition	The technical signal is the physical value of an external event coupled to an AUTOSAR system. Technical signals are represented in SI units (e.g. pressure in PA).
Initiator	General
Further	The term Technical Signal is used when we are referring to the "real world" signal
Explanations	that is under consideration. So typical Technical Signals are temperature, velocity, torque, force, electrical current and voltage, etc.
Comment	
Example	
Reference	

3.296 Template

Definition	A template is a structured collection of attributes that are required to formally describe AUTOSAR artifacts like e.g. software components or configurations of ECUs.
Initiator	Methodology and Templates
Further	The term "Template" stresses the fact that the collected attributes still need to
Explanations	have actual values assigned in order to describe a particular artifact. Those values are collected in a Description.
	Templates are independent of the technology used for serialization of their respective descriptions. Possible serializations include XML, databases tables and so on.
Comment	

	The templates defined by AUTOSAR are represented as an UML2.0 model (\rightarrow definition 3.28) and an W3C XML Schema (\rightarrow definition 3.36). Models and descriptions created according to the templates can be exchanged using the language defined in the AUTOSAR XML Schema).
Reference	

3.297 Timeout

Definition	Notification with respect to deadline violation of an event or task (e.g. while working on/with information: receiving, sending, processing, etc.).
Initiator	Software and Architecture
Further	
Explanations	
Comment	
Example	
Reference	

3.298 Uplink Port

Definition	A Uplink Port is a port of an automotive Ethernet switch which is connected to another Ethernet automotive switch (cascaded switch). A Uplink Port could either be an internal port or an external port. One Uplink Port is connected to another Uplink Port. The Uplink Port has a special role from the perspective of the software.
Initiator	Communication
Further	
Explanations	
Comment	
Example

3.299 Use Case

Definition	A model of the usage by the user of a system in order to realize a certain functional feature of the system.
Initiator	General
Further	
Explanations	
Comment	Added certain compared to EAST-glossary.
Example	
Reference	[EAST-Glossary]

3.300 Validation

Definition	Confirmation by examination and provisions of objective evidence that the particular requirements for a specific intended use are fulfilled.
Initiator	General
Further	In design and development, validation concerns the process of examining a
Explanations	product to determine conformity with user needs.
	Validation is normally performed on the final product under defined operating
	conditions. It may be necessary in earlier stages.
	"Validated" is used to designate the corresponding status.

	Multiple validations may be carried out if there are different intended uses. [ISO 8402: 1994]
Comment	
Example	
Reference	[IEEE 1012:1998]

3.301 Variability

Definition	Variability of a system is its quality to describe a set of variants. These variants are characterized by variant specific property settings and / or selections.
Initiator	Methodology and Templates
Further	
Explanations	
Comment	
Example	As an example, such a system property selection manifests itself in a particular "receive port" for a connection.
Reference	

3.302 Variant

Definition	A system variant is a concrete realization of a system, so that all its properties have been set respectively selected. The software system has no variability anymore with respect to the binding time.
Initiator	Methodology and Templates
Further	
Explanations	
Comment	
Example	
Reference	

3.303 Variant Coding

Definition	Adaptation of SW by selection of functional alternatives according to external requirements (e.g. country-dependent or legal restrictions).
Initiator	Software and Architecture
Further	The major difference with calibration is that this later doesn't aim to adapt the SW
Explanations	functionality itself but only aims to adjust the SW to the HW/SW environment, e.g. the calibration of engine control SW that is adjusted to the physical parameters of every engine. Variant Coding also includes vehicle-specific (not user-specific) SW adaptation due to end-customer wishes (e.g. deactivation of speed-dependent automatic locking). Variant Coding is always done after compile time. Used techniques to select variants include end-of-line programming and garage programming.
Comment	
Example	Country related adaptation of MMI with respect to speed and/or temperature unit (km/h vs. mph, °C vs. F).
Reference	

3.304 Variation Binding

Definition	A variant is the result of a variation binding process that resolves the variability of
	the system by assigning particular values/selections to all the system's properties.

Initiator	Methodology and Templates
Further	
Explanations	
Comment	
Example	
Reference	

3.305 Variation Binding Time

Definition	The variation binding time determines the step in the methodology at which the variability given by a set of variable properties is resolved.
Initiator	Methodology and Templates
Further	
Explanations	
Comment	
Example	
Reference	

3.306 Variation Definition Time

Definition	The variation definition time determines the step in the methodology at which the variation points are defined.
Initiator	Methodology and Templates
Further	
Explanations	
Comment	
Example	
Reference	

3.307 Variation Point

Definition	A variation point indicates that a property is subject to variation. Furthermore, it is associated with a condition and a binding time which define the system context for the selection / setting of a concrete variant.
Initiator	Methodology and Templates
Further	
Explanations	
Comment	
Example

3.308 Vendor ID

Definition	A vendor ID is a unique identification of the vendor of a software component. All basic software modules (\rightarrow definition 3.39) conformant to the AUTOSAR standard shall provide a readable vendor ID.
Initiator	General
Further Explanations	AUTOSAR Vendor IDs are used to determine vendors of basic software modules before and during runtime. The mechanism is used to improve bug handling. AUTOSAR currently only provides Vendor IDs to members of the AUTOSAR partnership.
Comment	To apply for an AUTOSAR vendor ID the possible member has to send an E-Mail

	to request@autosar.org. Within the request name of the company, company address and contact person should be listed.
Example	Vendor ID for EEPROM driver is called: EEP_VENDOR_ID
Reference	SRS_BSW_00374

3.309 Verification

Definition	Confirmation by examination and provisions of objective evidence that specified requirements have been fulfilled.
Initiator	General
Further Explanations	In design and development, verification concerns the process of examining the result of a given activity to determine conformity with the stated requirement for that activity. "Verified" is used to designate the corresponding status. [ISO 8402: 1994]
Comment	
Example	
Reference	[IEEE 1012:1998]

3.310 VFB View

Definition	 The VFB View describes systems or subsystems in the car independently of these resources; in other words, independently of: what kind of and how many ECUs are present in the car on what ECUs the entities in the VFB-View run how the ECUs are interconnected: what kind of network technology (CAN, LIN,) and what kind of topology (presence of gateways) is used
Initiator	Software and Architecture
Further	In the VFB-View, the system or subsystem under consideration is a Composition
Explanations	which consists out of Connectors and Components.
Comment	
Example	
Reference	[AUTOSAR Specification of Virtual Functional Bus]

3.311 Virtual Functional Bus

Definition	The Virtual Functional Bus is an abstraction of the communication between Atomic Software Components (\rightarrow definition 3.18) and AUTOSAR Services (\rightarrow definition 3.33). This abstraction is such that specification of the communication mechanisms is independent from the concrete technology chosen to realize the communication.
Initiator	Software and Architecture
Further Explanations	After compilation and linking of software for a dedicated ECU (\rightarrow definition 3.90) the Virtual Functional Bus interfaces are realized by the AUTOSAR Runtime Environment.
Comment	
Example	
Reference	

3.312 Virtual Integration

Definition The simulated, modeled and/or calculated (not real) combination of software entities forming a system (\rightarrow definition 3.290).

Initiator	Software and Architecture
Further	By virtual integration several constraints and/or requirements are checked without
Explanations	the need of real hardware units, like needed CPU load, needed memory,
	completeness of interfaces, fulfillment of timing requirements etc.).
Comment	
Example	
Reference	

3.313 Virtualization

Definition	Virtualization is a mechanism which hides the physical characteristics of a computing platform from the users, presenting instead another abstract computing platform. It can be used to fulfill functional safety requirements like availability, partitioning, resource conflict management, recovery etc.
Initiator	Safety
Further Explanations	 Different types of hardware virtualization include: Full virtualization – almost complete simulation of the actual hardware to allow software, which typically consists of a guest operating system, to run unmodified. Partial virtualization – some but not all of the target environment attributes are simulated. As a result, some guest programs may need modifications to run in such virtual environments. Paravirtualization – a hardware environment is not simulated; however, the guest programs are executed in their own isolated domains, as if they are running on a separate system. Guest programs need to be specifically modified to run in this environment.

3.314 Worst Case Execution Time

Definition	Maximum possible time during which a program is actually executing
Initiator	Software and Architecture
Further	The worst case execution time of a piece of software is the maximum possible
Explanations	time during which the CPU is executing instructions which belong to this piece. The worst case execution time is often identified by analytical methods. It is required to determine if a schedule meets the overall timing requirements. Abbreviation: WCET See also: response time, execution time, worst case response time
Comment	This definition has been extended by WP COM

3.315 Worst Case Response Time

Definition	Maximum possible time between receiving a stimulus and delivering an appropriate response or reaction.
Initiator	Software and Architecture
Further	The worst case response time describes the maximum possible time between a
Explanations	stimulus like e.g. the state change of hardware or software entity and the expected reaction of the system (e.g. response, actuator activation). Typically: worst-case execution-time + infrastructure-overhead + scheduling-policy = worst-case reaction time

	Synonym: worst case reaction time See also: response time, execution time, worst case execution time
Comment	Worst case reaction time, execution time, worst case execution time Worst case reaction time was renamed to worst case response time because response time is the more common terminology. This definition has been extended by WP COM.
