# 1 Introduction

## 1.1 Overview

This document contains the specification of the AUTOSAR Safety Extensions and realizes the requirements stated in [1]. Safety extensions are expressed by existing (generic) AUTOSAR meta-model concepts. Native meta-model concepts might be introduced in upcoming releases. Section 3 provides a more detailed overview on the extensions.

## 1.2 Scope

The scope of this document covers safety extensions that shall enable ISO 26262 development in an AUTOSAR context. These extensions allow a standardized exchange of safety information and provide the basis for consistent management among different vendors and tools as required by ISO 26262.

This document is not an introduction to functional safety in general or ISO 26262 in specific. Other safety standards or guidelines such as IEC 61508 or MISRA are out of scope.

## 1.3 Document Conventions

The representation of requirements in AUTOSAR documents follows the table specified in [TPS\_STDT\_00078], see Standardization Template, chapter Support for Traceability ([2]).

The verbal forms for the expression of obligation specified in [TPS\_STDT\_00053] shall be used to indicate requirements, see Standardization Template, chapter Support for Traceability ([2]).

## 1.4 Abbreviations

<i>Abbreviation</i>	<i>Meaning</i>
ASIL	Automotive Safety Integrity Level
DC	Diagnostic Coverage
ECC	Error Correction Code
EDC	Error Detection Code
HARA	Hazard Analysis and Risk Assessment
HW	Hardware
FSC	Functional Safety Concept
TSC	Technical Safety Concept
SEooC	Safety Element out of Context

SM	Safety Mechanism or Measure
SW	Software
SWC	Software Component
URI	Uniform Resource Identifier
URL	Uniform Resource Locator

**Table 1.1: Abbreviations**

## 1.5 Glossary of Terms

In general this document will use terms related to safety as defined in ISO 26262-1, *Vocabulary* (see [3]). For clarification table 1.2 lists some terms with definitions in relationship to AUTOSAR.

<i>Term</i>	<i>Definition</i>
ASIL attribute	The ASIL for elements of the system specify the necessary requirements of ISO 26262 and <b>safety measures</b> to apply for avoiding unreasonable residual risk. See section 5 for further details.
Fault, Failure, Error	A <b>fault</b> is an abnormal condition that <i>may</i> cause an HW or SW element to fail. An <b>error</b> describes the resulting discrepancy in a value or condition and is the consequence of a (set of) faults. A <b>failure</b> defines the termination of the ability of an HW or SW element to perform its function (see [3]). Faults comprise systematic SW faults (i.e. "defects", "bugs"), random HW faults (e.g. due to stress/aging of the equipment) as well as systematic HW faults.
Safe state	A safe state is always meant to be described on system level (see [3]). A certain software state <i>may</i> be part of this "system state" or the relation might be undefined (e.g. if the microcontroller running the software is switched off in the safe state).
Safety Mechanism	A safety mechanism is a <i>technical solution [...], to detect faults or control failures in order to achieve or maintain a safe state</i> (see [3]). The term is used in this specification exactly in this broader sense, so that not only the AUTOSAR safety mechanisms ("safety features") can be described, but any HW/SW or combined solution of the system for which an AUTOSAR software is implemented (cp. section 7).
Safety Measure	A safety measure is an <i>activity or solution to avoid systematic failures and to detect random hardware failures or control failures</i> (see [3]). Therefore, a safety measure might only define a process activity like dedicated testing methods, additional code verifications, and so on (cp. section 7). This specification will use the term safety measure to subsume both activities during development as well as safety measure implemented into the system.
Safety Requirement	ISO 26262 defines a hierarchy of safety requirements: safety goals, technical, hardware and software. In this document a safety requirement could be any of these. For details refer to ISO 26262-3, 4 and 9.

**Table 1.2: Glossary of terms**

## 1.6 Guidelines

Existing specifications shall be referenced (in form of a single requirement). Differences to these specifications are specified as additional requirements. All Requirements shall have the following properties:

- **Redundancy**  
Requirements shall not be repeated within one requirement or in other requirements.
- **Clearness**  
All requirements shall allow one possibility of interpretation only. Used technical terms that are not in the glossary must be defined.
- **Atomicity**  
Each Requirement shall only contain one requirement. A Requirement is atomic if it cannot be split up in further requirements.
- **Testability**  
Requirements shall be testable by analysis, review or test.
- **Traceability**  
The source and status of a requirement shall be visible at all times.

## 2 Requirements Tracing

The following table references the requirements specified in [1] and links to the fulfillments of these.

Requirement	Description	Satisfied by

### 3 Safety Extensions Overview

Safety is one of the key issues in automotive system design and development. ISO 26262 [3] defines the current standard for functional safety which impacts almost all development activities, including software specifications, design and implementation. This document enables a standardized exchange of this safety information in an AUTOSAR context and provide the basis for consistent management as required by ISO 26262.

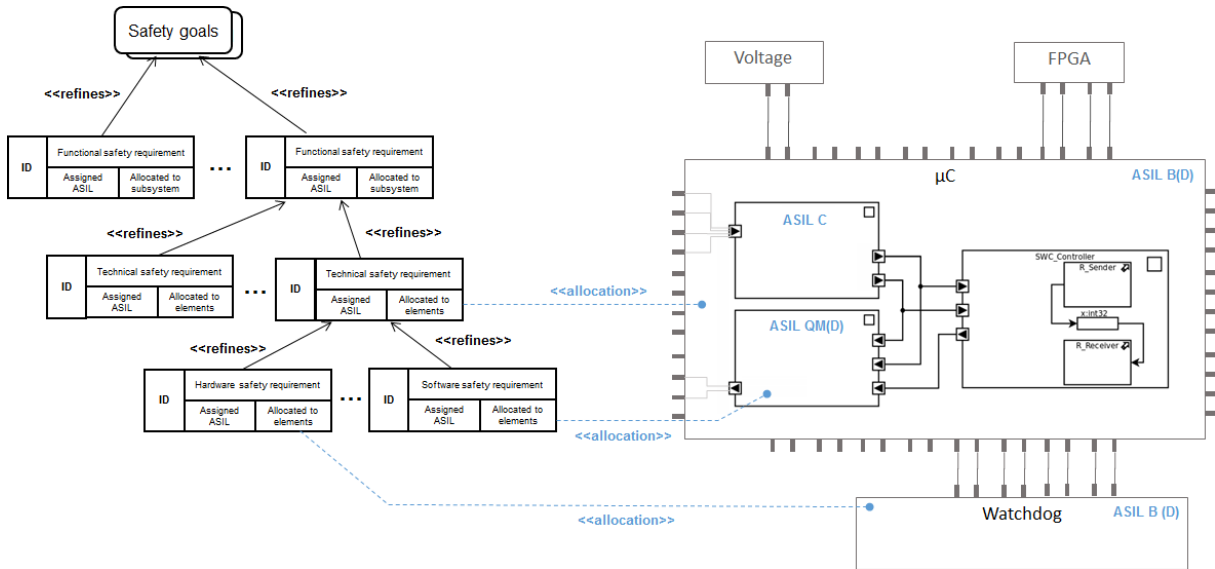

The AUTOSAR standard addresses functional safety already by providing a number of features that can be facilitated to implement safe software, for example end to end protection, program flow monitoring, memory partitioning, user/supervisor-modes, and so on. These *safety mechanisms* are recognized as one integral part of an AUTOSAR system design. However, additional requirements from ISO 26262 for functional safety software development need to be addressed, especially the following:

- Safety requirements – clearly distinguishable from other requirements and fulfilling the needs as specified by ISO 26262 parts 4 and 8 (section 4),
- Safety integrity levels – for each AUTOSAR element following the schema of ISO 26262-3 (section 5),
- Decomposition of safety requirements according to the needs as given in ISO 26262-9 (section 6)
- Traceability and allocation of safety requirements and safety measures according to ISO 26262 parts 4, 6 and 8 (section 6), and
- Safety measures and safety mechanisms as required by ISO 26262-4 (section 7). This goes beyond the pure SW safety mechanisms that exist in AUTOSAR and introduces an abstract way to reference any safety measure of a system architecture.

This specification follows the approach to reuse available documentation capabilities of AUTOSAR to address these requirements. This means that the `Safety Extensions` define rules to exchange the aforementioned work products by using existing meta-model concepts (e.g. `StructuredReq`, `TraceableText`, `trace`). Thereby, specifications of AUTOSAR remain backward compatible and can contain at the same time unified and tool-processable safety information for the development of safe SWCs and configurations (cp. RS-SafetyExtensions requirements [`RS_SAFEX_00020`] and [`RS_SAFEX_00021`]).

The hierarchy of safety requirements for a system (*item* development in ISO 26262) and its relation to an AUTOSAR software architecture is depicted in figure 3.1. The hierarchy of safety requirements starts with safety goals that are identified for the hazard-/hazardous events of the system. The ASIL is maintained as attribute at each safety goal and inherited consistently through the subsequent levels of functional safety requirements (as part of the FSC) and technical safety requirements (as part of the TSC). The latter will be refined into SW and HW safety requirements.

Each safety requirement<sup>1</sup> must be allocated properly to an element of the system architecture, i.e. component, HW, SW or both (HW and SW). Hence, an element of an AUTOSAR specification might receive an ASIL which indicates that it is in the scope of an ISO 26262 development.

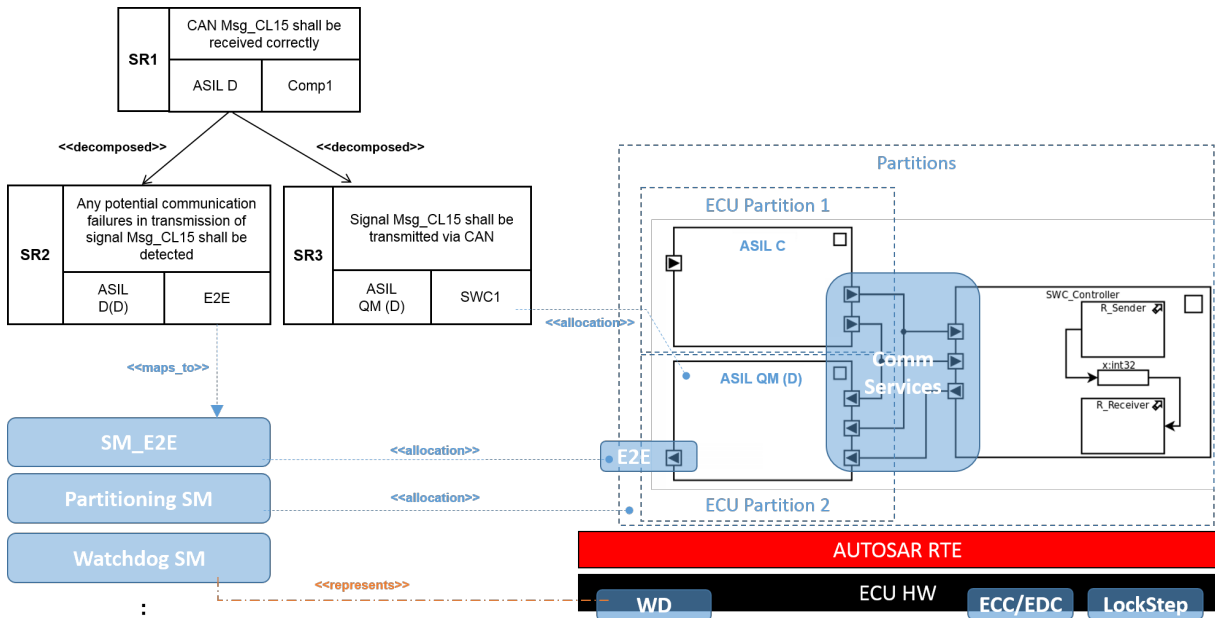

**Figure 3.1: Hierarchy of safety requirements and allocation to system architecture elements**

In cases where safety requirements are not available or will not be exchanged together with a specification, the AUTOSAR implementation must at least be *aware* that the element is used in a safety context. This is achieved by attaching the ASIL attribute to AUTOSAR elements independent from the allocation. Especially in cases of an SEooC development, where the safety requirements are not fully known at development time, the ASIL attribute supports the integration and verification of such parts in a later stage of development by matching the assumptions against the finalized safety requirements.

From the perspective of an AUTOSAR element the realization of allocated safety requirements is often dependent on the system context. For example, an implementer of a SWC shall be aware whether there is a memory protection (e.g by ECC/EDC/M-MU/MPU) supported by the underlying processor architecture in order to correctly implement the handling of safety related data. Especially decomposition and allocation of safety requirements to other elements of the architecture — as well as constraints and characteristics of supporting parts — need to be known during development time. This is generally the case for most error detection and error handling, degradation or timing aspects. For example, the system excerpt in figure 3.1 indicates the availability of an external HW watchdog that might be a supportive element in the error handling procedures (e.g. deadline or output monitoring). The example application software might rely on this *safety mechanism* for certain failures that cannot be detected by the component itself.

<sup>1</sup>Functional safety requirements are allocated to a higher-level functional/logical architecture

In order to convey the relevant information of this "safety context" for development, integration, and configuration of AUTOSAR software this specification provides an abstraction of *safety measure* or *safety mechanism* in addition to safety requirements. Figure 3.2 shows the concept of the abstraction of different safety mechanisms available in the software stack and/or ECU hardware.

**Figure 3.2: Safety measures, safety requirements and allocations to elements of the architecture**

As shown in the figure a (decomposed) safety requirement is first mapped to an abstract definition of a safety mechanism (here: *SM\_E2E*). In a subsequent step the safety mechanism is allocated to certain elements of an AUTOSAR model. In case the safety mechanism represents any other technology, this allocation is only implicit (not part of AUTOSAR). This allows for example the system integrator to verify whether freedom from interference in a decomposition is sufficiently achieved across the different technologies. Note that this abstraction is also useful, e.g. if the AUTOSAR (implementation) elements are not yet available in a distributed work between OEM supplier, but the system engineer wants to determine already what aspects are protected in which way by safety measures.

The individual activities of defining safety requirements or safety measures, allocating safety requirements, and so on is described in the AUTOSAR Methodology (cp. [4]). Hence, the Methodology addresses formally requirement [RS\_SAFEX\_00024] of [1]

## 4 Safety Requirements

This chapter defines how safety requirements will be mapped to AUTOSAR concepts. Basically, safety requirements follow the same rationale as normal requirements, but must fulfill additional criteria to meet ISO 26262 needs (cp. [3], part 8, clause 6.4.2). This comprises mainly additional attributes and characteristics that are addressed in AUTOSAR as follows:

- Safety requirements shall be unambiguously identifiable as safety requirements (see ISO 26262-8, clause 6.4.2.1). For this purpose requirements are tagged by the `category` attribute inherited by `StructuredReq`.
- Allocation information of safety requirements to elements of the (software) architecture shall be available (see ISO 26262-8, clause 6.4.2.3). Safety requirements are mapped to (any) object of the AUTOSAR architecture by means of a `trace`.
- Safety requirements shall have a unique identification that remains unchanged throughout the life-cycle of the requirement (ISO 26262-8, clause 6.4.2.5.a). This specification will make additional requirements on `shortName` usage for safety requirements.
- Safety requirements shall have a status attribute (ISO 26262-8, clause 6.4.2.5.b). The status attribute is different from the AUTOSAR lifecycle information defined for requirements and hence it is mapped to a `Sdg` property.
- Safety requirements shall have an ASIL (ISO 26262-8, clause 6.4.2.5.c). The ASIL attribute is mapped to a `Sdg` property.
- Safety requirements shall be structured hierarchically along design levels and each shall maintain a reference to the source at the upper level of the hierarchy (ISO 26262-8, clause 6.4.3.1 and clause 6.4.3.2). Since AUTOSAR allows the tracing of requirements as `TraceableText` there is no extension required for expressing these hierarchical dependencies.
- If ASIL decomposition is applied, the decomposition must follow a number of rules that are defined in ISO 26262-9, clause 5. This specification introduces a special trace type that supports the concept of ASIL decomposition individually on each safety requirement. Moreover, the ASIL decomposition notation is supported at the ASIL attribute, for example `ASIL B(D)`.

**[TPS\_SAFEX\_00101] Description of safety requirements** [Safety requirements shall be described as normal requirements using `StructuredReq` as defined in [TPS\_STDT\_00060]. The `description` shall contain the contents of the requirements.] ([RS\\_SAFEX\\_00001](#), [RS\\_SAFEX\\_00002](#), [RS\\_SAFEX\\_00012](#))

Note that this integrates seamlessly in the traceability of text defined for AUTOSAR specifications.

**[TPS\_SAFEX\_00103] Unique identifier of safety requirements** [Safety Requirements shall receive a unique ID across the extent of an AUTOSAR project. The ID

shall be maintained as `shortName` for further references to the requirement and correspond to the general rule [TPS\_GST\_00021].] (RS\_SAFEX\_00005)

Note that safety requirement identifiers are thus much stricter than normal short names defined by [constr\_2508]. The `shortName` is used as a global unique ID, which is similar to the uniqueness of other elements as described in [constr\_2538]. In addition, however, tools processing the safety extensions can facilitate the `uuid` attribute to persist tool related identifiers.

**[TPS\_SAFEX\_00102] Type of safety requirements** [Safety Requirements shall be marked unambiguously as safety requirement by the `category` attribute of `StructuredReq` set to one of the following:

- SAFETY\_GOAL
- SAFETY\_FUNCTIONAL
- SAFETY\_TECHNICAL
- SAFETY\_SOFTWARE
- SAFETY\_HARDWARE
- SAFETY\_EXTERNAL

These values extend the defined values in [constr\_2540] in [2] in the context of safety.] (RS\_SAFEX\_00004)

The ASIL attribute is defined in [TPS\_SAFEX\_00201].

**[TPS\_SAFEX\_00104] Status attribute** [Safety Requirements shall receive a `status` attribute as `AdminData` containing a `Sdg` data field with `gid="SAFEX"`. The XML contents shall contain an `Sd` element with attribute `gid="STATUS"`.] (RS\_SAFEX\_00006)

The values of the `status` attribute are not prescribed and implementation specific.

For various reasons, it is not practicable to exchange a whole hierarchy of safety requirements inside the scope of an AUTOSAR project and/or a set of AUTOSAR XML documents. For example, the reference to HW safety requirements or safety goals might be deliberately excluded or safety requirements might be reside in a requirements database. In order to support the linking of such safety requirements that reside outside of AUTOSAR, this specification introduces the concept of External Safety Requirements.

**[TPS\_SAFEX\_00105] External Safety Requirements** [An External Safety Requirement that shall be included *as reference* in an AUTOSAR document shall be marked with a `category` set to `SAFETY_EXTERNAL` and the `description` shall contain only an `Xfile` URI to the location where the safety requirement resides.] (RS\_SAFEX\_00003)

Optionally the ASIL and/or status attributes might be set (as cache) for convenience as defined in [TPS\_SAFEX\_00201] and [TPS\_SAFEX\_00104] as well as the `tool` and `toolVersion`.

The listing below shows an example how safety requirements shall be expressed in AUTOSAR XML (Note: This listing contains elements resulting from specification items introduced in later sections of this document):

## 5 Safety Integrity Levels

This specification is intended to support the Automotive Safety Integrity Level (ASIL) of ISO 26262 [3]. Other safety integrity levels will not be considered and are out of scope of this document.

The ASIL is determined as part of the HARA in the concept phase as of ISO 26262-3 and assigned to each safety goal. A system design – and finally the software architecture – will inherit this ASIL as an attribute via the allocation of safety requirements to the technical/software architecture (cp. section 3, see section 6 for allocation of safety requirements).

**[TPS\_SAFEX\_00201] ASIL attribute of safety requirements** [Safety requirements shall receive an ASIL attribute. The ASIL is stored at an [AdminData](#) that contains a [Sdg](#) data with `gid="SAFEX"`. The contents of this element shall contain an [Sd](#) element with attribute `gid="ASIL"`. Valid values for this attribute are:

- QM
- A
- B
- C
- D
- QM (A)
- QM (B)
- QM (C)
- QM (D)
- A (B)
- A (C)
- A (D)
- B (B)
- B (C)
- B (D)
- C (C)
- C (D)
- D (D)

]([RS\\_SAFEX\\_00010](#))

Note that the parentheses notation is used to express decomposed safety requirements. In this specification we will refer to the original ASIL (i.e. the value in parentheses) as the *contextual ASIL* before decomposition, since it belongs to the context of safety goal.

**[constr\_6200] Safety goals have no decomposed ASIL** [If a safety requirement is of type `SAFETY_GOAL` the valid values of the `ASIL` attribute are restricted to: QM, A, B, C, or D.]()

**[TPS\_SAFEX\_00202] ASIL for AUTOSAR elements (optional)** [All AUTOSAR elements should receive an `ASIL` attribute, if at least one safety requirement is allocated to it. The ASIL shall be added as `Sdg` data with `gid="SAFEX"` to the `AdminData` section in XML. The XML contents shall contain an `Sd` element with attribute `gid="ASIL"`, valid values are the same as in [\[TPS\\_SAFEX\\_00201\]](#).] ([RS\\_SAFEX\\_00011](#))

Note that the ASIL at an element according to [\[TPS\\_SAFEX\\_00202\]](#) is optional.<sup>1</sup> If the ASIL is not specified at the element, the semantics is that it is derived as highest ASIL from all of the allocated safety requirements.

**[constr\_6201] Consistency of ASIL values** [The ASIL of AUTOSAR elements and allocated safety requirements should be *consistent*. An ASIL is consistent if the value at an element is the same or higher of the maximum ASIL of allocated safety requirements.]()

Note that an ASIL of an AUTOSAR element might be higher than the ASIL of safety requirements for various reasons. For example, a SWC might be designed for reuse in higher safety integrity contexts and therefore be rated with higher ASIL. For decomposed requirements, however, it is open to interpretation how the contextual ASIL is considered in the comparison of ASIL values.

For an example of the ASIL attribute at safety requirements see listing [4.1](#).

#### Listing 5.1: Example for the AUTOSAR XML representation of an ASIL attribute at an element

```
<!-- Example AUTOSAR element with ASIL -->
<APPLICATION-SW-COMPONENT-TYPE>
  <SHORT-NAME>MyComponent</SHORT-NAME>
  <ADMIN-DATA>
    <SDGS>
      <SDG GID="SAFEX">
        <SD GID="ASIL">B</SD>
      </SDGS>
    </ADMIN-DATA>
  <PORTS>
  [...]
```

<sup>1</sup>This might be useful in an SEooC or carry-over development, where an existing specification is connected to safety requirements after implementation

## 6 Safety Requirements Traceability and Allocation

The essential characteristics of safety requirements according to ISO 26262 is the management and maintenance of traceability. This specification refers to *traceability of safety requirements* as the generic term for different types of links between (safety) requirements and other elements. Mainly three types of traces are distinguished:

1. *Refinement relations* between two levels of safety requirements, e.g. technical safety requirements that contribute to functional safety requirements (see ISO 26262-8, clause 6.4.3.1.a). This concept is similar to the upstream tracing of the AUTOSAR specification itself and will be realized in the same way.
2. *Allocation relations* from safety requirements to software architecture elements, e.g. a SW safety requirement allocated to a part of an AUTOSAR SWC (see ISO 26262-8, clause 6.4.2.3).
3. *Mapping relation* from safety requirements to safety measures/mechanisms, e.g. a safety requirement for a CRC that is mapped to an end to end protection safety mechanism (see ISO 26262-4, clauses 6.4.1, 6.4.2, and 6.4.6).

Note that traceability of safety requirements do not solely refer to references between text elements as in the current AUTOSAR documentation meta-model (see [TPS\_GST\_00243]). Therefore, the different relation types are managed in *Admin-Data* blocks using a *Referrable* reference (via *sdx* elements).

*Decomposition* is a specialization of the refinement relation that has architectural implications. A decomposition of a safety requirement requires two *independent* elements in the system architecture to exist, for which freedom from interference can be guaranteed. In order to trace these decompositions via decomposed safety requirements down to software, we are increasing the awareness of implementors and enable verification of the same e.g. during integration testing.

**[TPS\_SAFEX\_00301] Safety requirement refinement relations** [Refinement relations of safety requirements shall be expressed by *trace* associations. The direction of the trace has the semantic "refines".] (*RS\_SAFEX\_00007*)

**[TPS\_SAFEX\_00302] Decomposition of safety requirements** [Decomposition shall be specified at each of the two decomposing requirements into which a safety requirement is decomposed. For this purpose both of these decomposing requirements shall receive an *AdminData* entry containing a *Sdg* element named *gid*="DECOMPOSITION" that has a reference as *sdx* (i.e. *Referrable*) to the decomposed safety requirement.] (*RS\_SAFEX\_00008*)

**[constr\_6202] Decomposition into two safety requirements** [A decomposition as specified by [TPS\_SAFEX\_00302] shall be specified at exactly two decomposing safety requirements (not more) for each decomposed requirement.] ()

**[constr\_6203] Decomposing only one safety requirement** [Each decomposing requirement specified according to [TPS\_SAFEX\_00302] shall decompose maximum one other requirement.] ()

**[TPS\_SAFEX\_00303] Independence requirement link** [If safety requirements express a means to achieve freedom from interference for elements of a decomposition, they shall be listed in addition to the decomposed requirement at both of the decomposing safety requirements. Therefore the `AdminData` of each of the decomposing safety requirements receives a separate reference (`sdx` entry) in an `Sdg` element with `gid="INDEPENDENCE".`]([RS\\_SAFEX\\_00009](#))

Note that the decomposed safety requirement and the requirement for independence may receive in addition the "reversed" trace to the decomposing safety requirements. In that way the whole traceability hierarchy can be navigated seamlessly by tools that are not aware of safety extensions.

**[TPS\_SAFEX\_00306] Allocation of safety requirements to AUTOSAR elements** [Allocation of a safety requirement to AUTOSAR elements is expressed by means of a reference in the `AdminData` block that points to the AUTOSAR element. For each allocation reference, a `sdx` reference shall be listed in a combined `Sdg` element named `gid="ALLOCATION".`]([RS\\_SAFEX\\_00014](#))

An alternative to the direct allocation of safety requirements to AUTOSAR elements is first a *mapping* to safety measures (if applicable) and subsequently to AUTOSAR elements. For example, a safety requirement to ensure safe communication could be mapped to a safety mechanism "End to End Protection" which in turn is allocated to an end to end profile.

**[TPS\_SAFEX\_00305] Mapping of safety requirements to safety measures** [Allocation of a safety requirement to a safety measure shall be mapped to a `sdx` reference in an `Sdg` element (in `AdminData` block) with name `gid="MAPS_TO"` containing `sdx` references to the safety measure(s).]([RS\\_SAFEX\\_00022](#))

As fully equivalent alternative the safety mechanism may contain a backward link to the safety requirements it will realize:

**[TPS\_SAFEX\_00309] Alternative relationship of the mapping relation** [Mapping relations shall be expressed by a `trace` associations from the safety measure to the safety requirement. The direction of the trace has the semantic "realizes".]([RS\\_SAFEX\\_00022](#))

**[TPS\_SAFEX\_00307] Allocation of safety measures to AUTOSAR elements** [The mapping of a safety measure to one (or more) AUTOSAR element(s) shall be expressed in `AdminData` containing a `Sdg` named `gid="ALLOCATION"`, containing `sdx` references to the AUTOSAR elements.]([RS\\_SAFEX\\_00018](#))

From the perspective of an AUTOSAR element the allocation links have a *realizes* (or *satisfies*) semantics: the element has to implement all of the allocated safety requirements and defined safety mechanisms. Therefore this specification provides a fully equivalent alternative to these relations by means of a `realizes` relationship:<sup>1</sup>

---

<sup>1</sup>This might be useful in cases where the (safety) requirements specification is baselined and should not be changed

[TPS\_SAFEX\_00308] **Realizes relationship of AUTOSAR elements** [The allocation of safety requirements or safety measures may be expressed by a `realizes` reference. The reference shall be added as `Sdg` data to the `AdminData` section of the element with attribute `gid="REALIZES"`. The XML contents shall contain an `Sd` element with a list of `sdx` references referring to the allocated safety requirements.] (*RS\_SAFEX\_00014*)

## 7 Safety Measures

Safety of a system is achieved by means of *safety measures* that are applied at various stages of the development process and *safety mechanisms* which are implemented in a number of technologies into the system. This specification considers safety measures beyond the scope of the pure AUTOSAR software stack for a number of reasons:

- Software safety often relies on (external) hardware mechanisms for achieving its safety integrity, such as memory protection and partitioning, ECC/EDC, lock-step modes, external watchdogs, etc. During implementation these context dependencies should be explicitly part of the "runtime contract" for any software and not just implicitly communicated.
- Error detection and error handling will typically involve a complex interaction between both SW and HW, from the monitoring to the interrupt and handling routine(s), down to the shutoff paths of the actuator. Therefore any software safety mechanism shall be aware of the technological environment, safe state at system level, potential failures and constraints implied by the HW.
- Software integration requires verification of the effectiveness of the safety mechanisms. If the software specification states which safety mechanisms are implemented or which measures are conducted, consistency checks and (semi-) automatic verification becomes possible, which in turn reduces systematic failures.
- Finally, any software is influenced by the HW/platform on which it runs. Understanding and avoiding (systematic) failures is only possible if the system level intend for a safety mechanism is documented, accessible and well understood by the implementors.

AUTOSAR provides already a number of safety mechanisms and features that can be used to implement safe software, for example end to end protection, program flow monitoring, watchdog manager, and so on. These features can be used as target for a mapping of [TPS\_SAFEX\_00305]. Note that this specification does not specify any constraints on the textual descriptions except the requirements in this section.

**[TPS\_SAFEX\_00401] Definition of Safety Measure or Safety Mechanism** [A safety measure (or safety mechanism) shall be described as `TraceableText`. The `category` attribute shall mark the text block with `SAFETY_MEASURE` or `SAFETY_MECHANISM` respectively.] ([RS\\_SAFEX\\_00013](#), [RS\\_SAFEX\\_00015](#), [RS\\_SAFEX\\_00016](#), [RS\\_SAFEX\\_00023](#))

**[TPS\_SAFEX\_00402] Unique identifier for safety measures** [A safety measure/mechanism shall receive a unique identifier as `shortName`. The ID shall be unique across the extent of an AUTOSAR project.] ([RS\\_SAFEX\\_00017](#))

## 8 Application Notes

No specific application notes for the current version of this specification.

## A Mentioned Class Tables

For the sake of completeness, this chapter contains a set of class tables representing meta-classes mentioned in the context of this document, but which are not contained directly in the scope of describing specific meta-model semantics.

<b>Class</b>	<b>AdminData</b>			
<b>Package</b>	M2::MSR::AsamHdo::AdminData			
<b>Note</b>	<p>AdminData represents the ability to express administrative information for an element. This administration information is to be treated as meta-data such as revision id or state of the file. There are basically four kinds of meta-data</p> <ul style="list-style-type: none"> <li>• The language and/or used languages.</li> <li>• Revision information covering e.g. revision number, state, release date, changes. Note that this information can be given in general as well as related to a particular company.</li> <li>• Document meta-data specific for a company</li> </ul>			
<b>Base</b>	ARObject			
<b>Attribute</b>	<b>Type</b>	<b>Mult.</b>	<b>Kind</b>	<b>Note</b>
docRevision (ordered)	DocRevision	*	aggr	<p>This allows to denote information about the current revision of the object.</p> <p>Note that information about previous revisions can also be logged here. The entries shall be sorted descendant by date in order to reflect the history. Therefore the most recent entry representing the current version is denoted first.</p> <p><b>Tags:</b> xml.roleElement=true xml.roleWrapperElement=true xml.sequenceOffset=50 xml.typeElement=false xml.typeWrapperElement=false</p>
language	LEnum	0..1	attr	<p>This attribute specifies the master language of the document or the document fragment. The master language is the one in which the document is maintained and from which the other languages are derived from. In particular in case of inconsistencies, the information in the master language is priority.</p> <p><b>Tags:</b>xml.sequenceOffset=20</p>
sdg	Sdg	*	aggr	<p>This property allows to keep special data which is not represented by the standard model. It can be utilized to keep e.g. tool specific data.</p> <p><b>Stereotypes:</b> atpSplitable <b>Tags:</b> atp.Splitkey=sdg xml.roleElement=true xml.roleWrapperElement=true xml.sequenceOffset=60 xml.typeElement=false xml.typeWrapperElement=false</p>

Class	AdminData			
usedLanguages	MultiLanguagePlainText	0..1	aggr	This property specifies the languages which are provided in the document. Therefore it should only be specified in the top level admin data. For each language provided in the document there is one entry in MultiLanguagePlainText. The content of each entry can be used for illustration of the language. The used language itself depends on the language attribute in the entry.  <b>Tags:</b> xml.sequenceOffset=30

**Table A.1: AdminData**

Class	<i>Identifiable</i> (abstract)			
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::Identifiable			
Note	Instances of this class can be referred to by their identifier (within the namespace borders). In addition to this, Identifiables are objects which contribute significantly to the overall structure of an AUTOSAR description. In particular, Identifiables might contain Identifiables.			
Base	<i>ARObject</i> , <i>MultilanguageReferrable</i> , <i>Referrable</i>			
Subclasses	<p> <i>ARPackage</i>, <i>AbstractEvent</i>, <i>AbstractImplementationDataTypeElement</i>, <i>AbstractServiceInstance</i>, <i>ApplicationEndpoint</i>, <i>ApplicationError</i>, <i>ApplicationPartitionToEcuPartitionMapping</i>, <i>AsynchronousServerCallResultPoint</i>, <i>AtpBlueprint</i>, <i>AtpBlueprintable</i>, <i>AtpClassifier</i>, <i>AtpFeature</i>, <i>AutosarOperationArgumentInstance</i>, <i>AutosarVariableInstance</i>, <i>BswInternalTriggeringPoint</i>, <i>BswModuleDependency</i>, <i>BuildActionEntity</i>, <i>BuildActionEnvironment</i>, <i>CanTpAddress</i>, <i>CanTpChannel</i>, <i>CanTpNode</i>, <i>Chapter</i>, <i>ClassContentConditional</i>, <i>ClientIdDefinition</i>, <i>ClientServerOperation</i>, <i>Code</i>, <i>CollectableElement</i>, <i>ComManagementMapping</i>, <i>CommConnectorPort</i>, <i>CommunicationConnector</i>, <i>CommunicationController</i>, <i>Compiler</i>, <i>ConsistencyNeeds</i>, <i>ConsumedEventGroup</i>, <i>CouplingPort</i>, <i>CouplingPortStructuralElement</i>, <i>CryptoServiceMapping</i>, <i>DataPrototypeGroup</i>, <i>DataTransformation</i>, <i>DependencyOnArtifact</i>, <i>DiagEventDebounceAlgorithm</i>, <i>DiagnosticConnectedIndicator</i>, <i>DiagnosticDataElement</i>, <i>DiagnosticFunctionInhibitSource</i>, <i>DiagnosticMasterToSlaveEventMapping</i>, <i>DiagnosticRoutineSubfunction</i>, <i>DitArgument</i>, <i>DitLogChannel</i>, <i>DitMessage</i>, <i>DolpInterface</i>, <i>DolpLogicAddress</i>, <i>ECUMapping</i>, <i>EOCExecutableEntityRefAbstract</i>, <i>EcuPartition</i>, <i>EcucContainerValue</i>, <i>EcucDefinitionElement</i>, <i>EcucDestinationUriDef</i>, <i>EcucEnumerationLiteralDef</i>, <i>EcucQuery</i>, <i>EcucValidationCondition</i>, <i>EndToEndProtection</i>, <i>ExclusiveArea</i>, <i>ExecutableEntity</i>, <i>ExecutionTime</i>, <i>FMAttributeDef</i>, <i>FMFeatureMapAssertion</i>, <i>FMFeatureMapCondition</i>, <i>FMFeatureMapElement</i>, <i>FMFeatureRelation</i>, <i>FMFeatureRestriction</i>, <i>FMFeatureSelection</i>, <i>FlatInstanceDescriptor</i>, <i>FlexrayArTpNode</i>, <i>FlexrayTpConnectionControl</i>, <i>FlexrayTpNode</i>, <i>FlexrayTpPduPool</i>, <i>FrameTriggering</i>, <i>GeneralParameter</i>, <i>GlobalTimeGateway</i>, <i>GlobalTimeMaster</i>, <i>GlobalTimeSlave</i>, <i>HeapUsage</i>, <i>HwAttributeDef</i>, <i>HwAttributeLiteralDef</i>, <i>HwPin</i>, <i>HwPinGroup</i>, <i>IPSecRule</i>, <i>IPv6ExtHeaderFilterList</i>, <i>ISignalToIPduMapping</i>, <i>ISignalTriggering</i>, <i>IdentCaption</i>, <i>InternalTriggeringPoint</i>, <i>J1939SharedAddressCluster</i>, <i>J1939TpNode</i>, <i>Keyword</i>, <i>LifeCycleState</i>, <i>LinScheduleTable</i>, <i>LinTpNode</i>, <i>Linker</i>, <i>MacMulticastGroup</i>, <i>McDataInstance</i>, <i>MemorySection</i>, <i>ModeDeclaration</i>, <i>ModeDeclarationMapping</i>, <i>ModeSwitchPoint</i>, <i>NetworkEndpoint</i>, <i>NmCluster</i>, <i>NmEcu</i>, <i>NmNode</i>, <i>NvBlockDescriptor</i>, <i>PackageableElement</i>, <i>ParameterAccess</i>, <i>PduToFrameMapping</i>, <i>PduTriggering</i>, <i>PerInstanceMemory</i>, <i>PhysicalChannel</i>, <i>PortGroup</i>, <i>PortInterfaceMapping</i>, <i>PossibleErrorReaction</i>, <i>ResourceConsumption</i>, <i>RootSwCompositionPrototype</i>, <i>RptComponent</i>, <i>RptContainer</i>, <i>RptExecutableEntity</i>, <i>RptExecutableEntityEvent</i>, <i>RptExecutionContext</i>, <i>RptProfile</i>, <i>RptServicePoint</i>, <i>RunnableEntityGroup</i>, <i>SdgAttribute</i>, <i>SdgClass</i>, <i>SecureCommunicationAuthenticationProps</i>, <i>SecureCommunicationFreshnessProps</i>, <i>ServerCallPoint</i>, <i>ServiceNeeds</i>, <i>SignalServiceTranslationElementProps</i>, <i>SignalServiceTranslationEventProps</i>, <i>SignalServiceTranslationProps</i>, <i>SocketAddress</i>, <i>SomeipTpChannel</i>, <i>SpecElementReference</i>, <i>StackUsage</i>, <i>StaticSocketConnection</i>, <i>StructuredReq</i>, <i>SwGenericAxisParamType</i>, <i>SwServiceArg</i>, <i>SwcServiceDependency</i>, <i>SwcToApplicationPartitionMapping</i>, <i>SwcToEcuMapping</i>, <i>SwcToImplMapping</i>, <i>SystemMapping</i>, <i>TcpOptionFilterList</i>, <i>TimingCondition</i>, <i>TimingConstraint</i>, <i>TimingDescription</i>, <i>TimingExtensionResource</i>, <i>TimingModelInstance</i>, <i>TlsCryptoCipherSuite</i>, <i>Topic1</i>, <i>TpAddress</i>, <i>TraceableTable</i>, <i>TraceableText</i>, <i>TracedFailure</i>, <i>TransformationProps</i>, <i>TransformationTechnology</i>, <i>Trigger</i>, <i>VariableAccess</i>, <i>VariationPointProxy</i>, <i>ViewMap</i>, <i>VlanConfig</i>, <i>WaitPoint</i> </p>			
Attribute	Type	Mult.	Kind	Note

<b>Class</b>	<b>Identifiable</b> (abstract)			
adminData	<a href="#">AdminData</a>	0..1	aggr	This represents the administrative data for the identifiable object. <b>Tags:</b> xml.sequenceOffset=-40
annotation	Annotation	*	aggr	Possibility to provide additional notes while defining a model element (e.g. the ECU Configuration Parameter Values). These are not intended as documentation but are mere design notes. <b>Tags:</b> xml.sequenceOffset=-25
category	CategoryString	0..1	attr	The category is a keyword that specializes the semantics of the Identifiable. It affects the expected existence of attributes and the applicability of constraints. <b>Tags:</b> xml.sequenceOffset=-50
desc	MultiLanguageOverview Paragraph	0..1	aggr	This represents a general but brief (one paragraph) description what the object in question is about. It is only one paragraph! Desc is intended to be collected into overview tables. This property helps a human reader to identify the object in question.  More elaborate documentation, (in particular how the object is built or used) should go to "introduction". <b>Tags:</b> xml.sequenceOffset=-60
introduction	DocumentationBlock	0..1	aggr	This represents more information about how the object in question is built or is used. Therefore it is a DocumentationBlock. <b>Tags:</b> xml.sequenceOffset=-30
uuid	String	0..1	attr	The purpose of this attribute is to provide a globally unique identifier for an instance of a meta-class. The values of this attribute should be globally unique strings prefixed by the type of identifier. For example, to include a DCE UUID as defined by The Open Group, the UUID would be preceded by "DCE:". The values of this attribute may be used to support merging of different AUTOSAR models. The form of the UUID (Universally Unique Identifier) is taken from a standard defined by the Open Group (was Open Software Foundation). This standard is widely used, including by Microsoft for COM (GUIDs) and by many companies for DCE, which is based on CORBA. The method for generating these 128-bit IDs is published in the standard and the effectiveness and uniqueness of the IDs is not in practice disputed. If the id namespace is omitted, DCE is assumed. An example is "DCE:2fac1234-31f8-11b4-a222-08002b34c003". The uuid attribute has no semantic meaning for an AUTOSAR model and there is no requirement for AUTOSAR tools to manage the timestamp. <b>Tags:</b> xml.attribute=true

**Table A.2: Identifiable**

<b>Class</b>	<b>Referrable</b> (abstract)
<b>Package</b>	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::Identifiable
<b>Note</b>	Instances of this class can be referred to by their identifier (while adhering to namespace borders).
<b>Base</b>	<i>AObject</i>

<b>Class</b>	<b>Referrable</b> (abstract)			
<b>Subclasses</b>	<i>AtpDefinition, BswDistinguishedPartition, BswModuleCallPoint, BswModuleClientServerEntry, BswVariableAccess, CouplingPortTrafficClassAssignment, DiagnosticDebounceAlgorithmProps, DiagnosticEnvModeElement, EthernetPriorityRegeneration, EventHandler, ExclusiveAreaNestingOrder, HwDescriptionEntity, ImplementationProps, LinSlaveConfigIdent, ModeTransition, MultilanguageReferrable, PduActivationRoutingGroup, PncMappingIdent, SingleLanguageReferrable, SoConIPdulIdentifier, SocketConnectionBundle, TimeSyncServerConfiguration, TpConnectionIdent</i>			
<b>Attribute</b>	<b>Type</b>	<b>Mult.</b>	<b>Kind</b>	<b>Note</b>
shortName	Identifier	1	attr	This specifies an identifying shortName for the object. It needs to be unique within its context and is intended for humans but even more for technical reference.  <b>Tags:</b> xml.enforceMinMultiplicity=true xml.sequenceOffset=-100
shortName Fragment	ShortNameFragment	*	aggr	This specifies how the Referrable.shortName is composed of several shortNameFragments.  <b>Tags:</b> xml.sequenceOffset=-90

**Table A.3: Referrable**

<b>Class</b>	<b>Sd</b>			
<b>Package</b>	M2::MSR::AsamHdo::SpecialData			
<b>Note</b>	This class represents a primitive element in a special data group.			
<b>Base</b>	<i>ARObject</i>			
<b>Attribute</b>	<b>Type</b>	<b>Mult.</b>	<b>Kind</b>	<b>Note</b>
gid	NameToken	1	attr	This attributes specifies an identifier. Gid comes from the SGML/XML-Term "Generic Identifier" which is the element name in XML. The role of this attribute is the same as the name of an XML - element.  <b>Tags:</b> xml.attribute=true
value	VerbatimStringPlain	1	attr	This is the value of the special data.  <b>Tags:</b> xml.roleElement=false xml.roleWrapperElement=false xml.typeElement=false xml.typeWrapperElement=false
xmlSpace	XmlSpaceEnum	0..1	attr	This attribute is used to signal an intention that in that element, white space should be preserved by applications. It is defined according to xml:space as declared by W3C.  <b>Tags:</b> xml.attribute=true xml.attributeRef=true xml.enforceMinMultiplicity=true xml.name=space xml.nsPrefix=xml

**Table A.4: Sd**

<b>Class</b>	<b>Sdg</b>			
<b>Package</b>	M2::MSR::AsamHdo::SpecialData			
<b>Note</b>	<p>Sdg (SpecialDataGroup) is a generic model which can be used to keep arbitrary information which is not explicitly modeled in the meta-model.</p> <p>Sdg can have various contents as defined by sdgContentsType. Special Data should only be used moderately since all elements should be defined in the meta-model.</p> <p>Thereby SDG should be considered as a temporary solution when no explicit model is available. If an sdg Caption is available, it is possible to establish a reference to the sdg structure.</p>			
<b>Base</b>	ARObject			
<b>Attribute</b>	<b>Type</b>	<b>Mult.</b>	<b>Kind</b>	<b>Note</b>
gid	NameToken	1	attr	<p>This attributes specifies an identifier. Gid comes from the SGML/XML-Term "Generic Identifier" which is the element name in XML. The role of this attribute is the same as the name of an XML - element.</p> <p><b>Tags:</b>xml.attribute=true</p>
sdgCaption	SdgCaption	0..1	aggr	<p>This aggregation allows to assign the properties of Identifiable to the sdg. By this, a shortName etc. can be assigned to the Sdg.</p> <p><b>Tags:</b>xml.sequenceOffset=20</p>
sdgCaptionRef	SdgCaption	0..1	ref	<p>This association allows to reuse an already existing caption.</p> <p><b>Tags:</b> xml.name=SDG-CAPTION-REF xml.sequenceOffset=25</p>
sdgContentsType	<a href="#">SdgContents</a>	0..1	aggr	<p>This is the content of the Sdg.</p> <p><b>Tags:</b> xml.roleElement=false xml.roleWrapperElement=false xml.sequenceOffset=30 xml.typeElement=false xml.typeWrapperElement=false</p>

**Table A.5: Sdg**

<b>Class</b>	<<atpMixed>> <b>SdgContents</b>			
<b>Package</b>	M2::MSR::AsamHdo::SpecialData			
<b>Note</b>	This meta-class represents the possible contents of a special data group. It can be an arbitrary mix of references, of primitive special data and nested special data groups.			
<b>Base</b>	ARObject			
<b>Attribute</b>	<b>Type</b>	<b>Mult.</b>	<b>Kind</b>	<b>Note</b>
sd	<a href="#">Sd</a>	0..1	aggr	<p>This is one particular special data element.</p> <p><b>Tags:</b>xml.sequenceOffset=40</p>
sdf	<a href="#">Sdf</a>	0..1	aggr	<p>This is one particular special data element.</p> <p><b>Tags:</b>xml.sequenceOffset=60</p>
sdg	<a href="#">Sdg</a>	0..1	aggr	<p>This aggregation allows to express nested special data groups. By this, any structure can be represented in SpeicalData.</p> <p><b>Stereotypes:</b> atpVariation <b>Tags:</b> vh.latestBindingTime=postBuild xml.sequenceOffset=50</p>

Class	<<atpMixed>> SdgContents			
sdx	<a href="#">Referrable</a>	0..1	ref	Reference to any identifiable element. This allows to use Sdg even to establish arbitrary relationships.
sdxif	<a href="#">Referrable</a>	0..1	ref	Additional reference with variant support. <b>Stereotypes:</b> atpVariation <b>Tags:</b> vh.latestBindingTime=postBuild

**Table A.6: SdgContents**

Class	StructuredReq			
<b>Package</b>	M2::MSR::Documentation::BlockElements::RequirementsTracing			
<b>Note</b>	This represents a structured requirement. This is intended for a case where specific requirements for features are collected. Note that this can be rendered as a labeled list.			
<b>Base</b>	<i>ARObject</i> , <i>DocumentViewSelectable</i> , <i>Identifiable</i> , <i>MultilanguageReferrable</i> , <i>Paginateable</i> , <i>Referrable</i> , <i>Traceable</i>			
Attribute	Type	Mult.	Kind	Note
appliesTo	standardNameEnum	*	attr	This attribute represents the platform the requirement is assigned to. <b>Tags:</b> xml.namePlural=APPLIES-TO-DEPENDENCIES xml.sequenceOffset=25
conflicts	DocumentationBlock	0..1	aggr	This represents an informal specification of conflicts. <b>Tags:</b> xml.sequenceOffset=40
date	DateTime	1	attr	This represents the date when the requirement was initiated. <b>Tags:</b> xml.sequenceOffset=5
dependencies	DocumentationBlock	0..1	aggr	This represents an informal specification of dependencies. Note that upstream tracing should be formalized in the property trace provided by the superclass Traceable. <b>Tags:</b> xml.sequenceOffset=30
description	DocumentationBlock	0..1	aggr	This represents the general description of the requirement. <b>Tags:</b> xml.sequenceOffset=10
importance	String	1	attr	This allows to represent the importance of the requirement. <b>Tags:</b> xml.sequenceOffset=8
issuedBy	String	1	attr	This represents the person, organization or authority which issued the requirement. <b>Tags:</b> xml.sequenceOffset=6
rationale	DocumentationBlock	0..1	aggr	This represents the rationale of the requirement. <b>Tags:</b> xml.sequenceOffset=20
remark	DocumentationBlock	0..1	aggr	This represents an informal remark. Note that this is not modeled as annotation, since these remark is still essential part of the requirement. <b>Tags:</b> xml.sequenceOffset=60

Class	StructuredReq			
supportingMaterial	DocumentationBlock	0..1	aggr	This represents an informal specification of the supporting material. <b>Tags:</b> xml.sequenceOffset=50
testedItem	<a href="#">Traceable</a>	*	ref	This association represents the ability to trace on the same specification level. This supports for example the of acceptance tests. <b>Tags:</b> xml.sequenceOffset=70
type	String	1	attr	This attribute allows to denote the type of requirement to denote for example is it an "enhancement", "new feature" etc. <b>Tags:</b> xml.sequenceOffset=7
useCase	DocumentationBlock	0..1	aggr	This describes the relevant use cases. Note that formal references to use cases should be done in the trace relation. <b>Tags:</b> xml.sequenceOffset=35

**Table A.7: StructuredReq**

Class	<i>TraceReferrable</i> (abstract)			
Package	M2::MSR::Documentation::BlockElements::RequirementsTracing			
Note	This meta class is intended to add the category to the subclasses of <a href="#">Traceable</a> . Even if the model seems to be a bit awkward, it ensures backwards compatibility of the schema. This approach allows to have subclasses of <a href="#">Traceable</a> which are either <a href="#">Identifiable</a> or only <a href="#">Referrable</a> while still maintaining the consistent sequence of <code>shortName</code> , <code>longName</code> , <code>category</code> .			
Base	<i>ARObject</i> , <i>MultilanguageReferrable</i> , <a href="#">Referrable</a>			
Subclasses				
Attribute	Type	Mult.	Kind	Note
–	–	–	–	–

**Table A.8: TraceReferrable**

Class	<i>Traceable</i> (abstract)			
Package	M2::MSR::Documentation::BlockElements::RequirementsTracing			
Note	This meta class represents the ability to be subject to tracing within an AUTOSAR model. Note that it is expected that its subclasses inherit either from <a href="#">MultilanguageReferrable</a> or from <a href="#">Identifiable</a> . Nevertheless it also inherits from <a href="#">MultilanguageReferrable</a> in order to provide a common reference target for all <a href="#">Traceables</a> .			
Base	<i>ARObject</i> , <i>MultilanguageReferrable</i> , <a href="#">Referrable</a>			
Subclasses	<a href="#">StructuredReq</a> , <a href="#">TimingConstraint</a> , <a href="#">TraceableTable</a> , <a href="#">TraceableText</a>			
Attribute	Type	Mult.	Kind	Note
–	–	–	–	–

Class	Traceable (abstract)			
trace	<a href="#">Traceable</a>	*	ref	<p>This association represents the ability to trace to upstream requirements / constraints. This supports for example the bottom up tracing</p> <p>ProjectObjectives &lt;- MainRequirements &lt;- Features &lt;- RequirementSpecs &lt;- BSW/Al</p> <p><b>Tags:</b>xml.sequenceOffset=20</p>

**Table A.9: Traceable**

Class	TraceableText			
<b>Package</b>	M2::MSR::Documentation::BlockElements::RequirementsTracing			
<b>Note</b>	<p>This meta-class represents the ability to denote a traceable text item such as requirements etc.</p> <p>The following approach applies:</p> <ul style="list-style-type: none"> <li>• <b>shortName</b> represents the tag for tracing</li> <li>• <b>longName</b> represents the head line</li> <li>• <b>category</b> represents the kind of the tagged text</li> </ul>			
<b>Base</b>	<i>ARObject</i> , <i>DocumentViewSelectable</i> , <i>Identifiable</i> , <i>MultilanguageReferrable</i> , <i>Paginateable</i> , <i>Referrable</i> , <i>Traceable</i>			
Attribute	Type	Mult.	Kind	Note
text	DocumentationBlock	1	aggr	<p>This represents the text to which the tag applies.</p> <p><b>Tags:</b> xml.roleElement=false xml.roleWrapperElement=false xml.sequenceOffset=30 xml.typeElement=false xml.typeWrapperElement=false</p>

**Table A.10: TraceableText**

Class	Xfile			
<b>Package</b>	M2::MSR::Documentation::TextModel::InlineTextElements			
<b>Note</b>	This represents to reference an external file within a documentation.			
<b>Base</b>	<i>ARObject</i> , <i>Referrable</i> , <i>SingleLanguageReferrable</i>			
Attribute	Type	Mult.	Kind	Note
tool	String	0..1	attr	<p>This element describes the tool which was used to generate the corresponding Xfile . Kept as a string since no specific syntax can be provided to denote a tool.</p> <p><b>Tags:</b>xml.sequenceOffset=50</p>
toolVersion	String	0..1	attr	<p>This element describes the tool version which was used to generate the corresponding xfile. Kept as a string, since no specific syntax can be specified.</p> <p><b>Tags:</b>xml.sequenceOffset=60</p>
url	Url	0..1	aggr	<p>This represents the URL of the external file.</p> <p><b>Tags:</b>xml.sequenceOffset=30</p>

**Table A.11: Xfile**
