# Contents

# 1 Introduction and functional overview

The Communication Manager Module (COM Manager, ComM) is a component of the Basic Software (BSW). It is a Resource Manager, which encapsulates the control of the underlying communication services. The ComM module controls basic software modules relating to communication and not software components or runnable entities. The ComM module collects the bus communication access requests from communication requestors (see definition of term "User" in chapter 2) and coordinates the bus communication access requests.

The purpose of the ComM module is:

Simplifying the usage of the bus communication stack for the user. This includes a simplified network management handling.

Coordinating the availability of the bus communication stack (allow sending and receiving of signals) of multiple independent software components on one ECU.

*Comment:* A user should not have any knowledge about the hardware (e.g. on which channel to communicate). A user simply requests a "Communication Mode" and ComM module switches the communication capability of the corresponding channel on/off.

Offer an API to disable sending of signals to prevent the ECU from (actively) waking up the communication bus.

*Comment:* On CAN every message wakes up the bus, on FlexRay it is only possible to wake up the bus with a so called wake-up pattern.

Controlling of more than one communication bus channel of an ECU by implementing a channel state machine for every channel.

*Comment:* The ComM module requests a Communication Mode from the corresponding Bus State Manager module. The actual bus states are controlled by the corresponding Bus State Manager module.

Offering the possibility to force an ECU that keeps the bus awake to the 'No Communication' mode (see section 7.4.1.2 for details).

Simplifying the resource management by allocating all resources necessary for the requested Communication Mode.

*Comment:* E.g. check if communication is allowed when a user requests 'Full Communication' mode, and prevent the ECU from shutdown during communication.

Further, the PNC extension allows users to request and keep awake a logical group of ECUs all over the network, a so-called "partial network cluster". The "PNC gateway" allows to span these (logical) network clusters over different, hierarchically structured physical busses and networks

# 2 Acronyms and definitions

The glossary below includes acronyms and abbreviations relevant to the Communication Manager module that are not included in the [1].

| Abbreviation / Acronym: | Description: |
|---|---|
| BSW | Basic Software |
| BswM | Basic Software Mode Manager |
| ComM | Communication Manager |
| DCM | Diagnostic Communication Manager |
| Det | Default Error Tracer |
| EcuM | ECU State Manager module |
| I-PDU | Information Protocol Data Unit |
| NM | Network Management |
| PDU | Protocol Data Unit |
| SW-C | Software Component |
| VMM | Vehicle Message Matrix |
| OA TC10 | Open Alliance TC10 specification (see [2]) |
| IRA | Internal Request Array. This is a bit vector which contains the aggregated internal PNC requests per channel. (see also chapter 8.6.2 "Nm_UpdateIRA") |
| EIRA | External and Internal Request Array. This is a bit vector which contains the aggregated external and internal PNC requests |
| ERA | External Request Array. This is a bit vector which contains the aggregated external PNC requests. Each ComMChannel which has a `ComMPncGatewayType` set is has one corresponding ERA |
| ERAn | All External Request Arrays which are available in ComM, i.e. "n" ComMChannels where `ComMPncGatewayType` is set, result in "n" External Request Arrays in ComM |

**Table 2.1: Acronyms and abbreviations used in the scope of this Document**

| Term: | Description: |
|---|---|
| DCM_ActiveDiagnostic indication | The DCM module indicates an active diagnostic session. DCM need "full communication" = COMM_FULL_COMMUNICATION for diagnostic purpose |
| Active wake-up | Wake-up caused by the hosting ECU e.g. by a sensor. |
| Application signal scheduling | Sending of application signals according to the VMM. Scheduling of CAN application signals is performed by the Communication Module, scheduling of LIN application I-PDUs (a PDU containing signals) is performed by the LIN interface and scheduling of FlexRay application PDUs is performed by the FlexRay Interface module. |
| Bus sleep | No activity required on the communication bus (e.g. CAN bus sleep). |
| Bus communication messages | Bus communication messages are all messages that are sent on the communication bus. This can be either a diagnostic message or an application message. |
| COM Inhibition status | Defines whether full communication, silent communication or wake-up is allowed or not. |
| Communication Channel | The medium used to convey information from a sender (or transmitter) to a receiver. |
| Communication Mode | Mode determining which kind of communication are allowed:<br><br>"full communication" = COMM_FULL_COMMUNICATION<br><br>"no communication" = COMM_NO_COMMUNICATION<br><br>"silent communication" = COMM_SILENT_COMMUNICATION<br><br>Note: COMM_SILENT_COMMUNICATION can not be requested by a user. Internal mode for synchronizing network at shutdown |
| Diagnostic PDU scheduling | Sending of diagnostic PDUs. Scheduling of CAN diagnostic PDUs is performed by the diagnostic module, scheduling of LIN diagnostic PDUs is performed by the diagnostic module and the LIN interface and scheduling of FlexRay diagnostic PDUs is performed by the diagnostic module and the FlexRay Interface module. |
| ECU shut down | See ECU State Manager specification [3]. |
| Fan-out | Same message/indication are sent to multiple destinations/receivers |
| Independent software component | A separately developed software component performing a coherent set of functions with a minimum amount of interfaces to other software applications on an ECU. This can be e.g. a basic software component or an application software component. |
| Passive wake-up | Wake-up by another ECU and propagated (e.g. by bus or wake-up-line) to the ECU currently in focus. |
| System User | An administration functionality (a specific "user", which is generated within the internal context of the ComM) for making a default request and for overriding the user requests. |
| User | Concept for requestors of the ECU State Manager module and of the Communication Manager Module. A user may be the BswM, a runnable entity, a SW-C or a group of SW-Cs, which act as a single unit towards the ECU State Manager module and the Communication Manager Module. |
| User Request | A User can request different Communication Modes from ComM |
| Managed channel | A ComM channel that is referenced exclusively from one other channel by ECUC parameter ComMManageReference. |
| Managing channel | A ComM channel that references 1..n other channels by ECUC parameter ComMManageReference. |

## 3.2 Related specification

AUTOSAR provides a General Specification on Basic Software modules [6], which is also valid for Communication Manager.

Thus, the specification SWS BSW General shall be considered as additional and required specification for Communication Manager.

# 4 Constraints and assumptions

## 4.1 Limitations

No limitations.

## 4.2 Applicability to car domains

No restrictions.

# 5 Dependencies to other modules

A context view which shows the Communication Manager Module and the dependencies to other modules is shown in Figure 5.1:

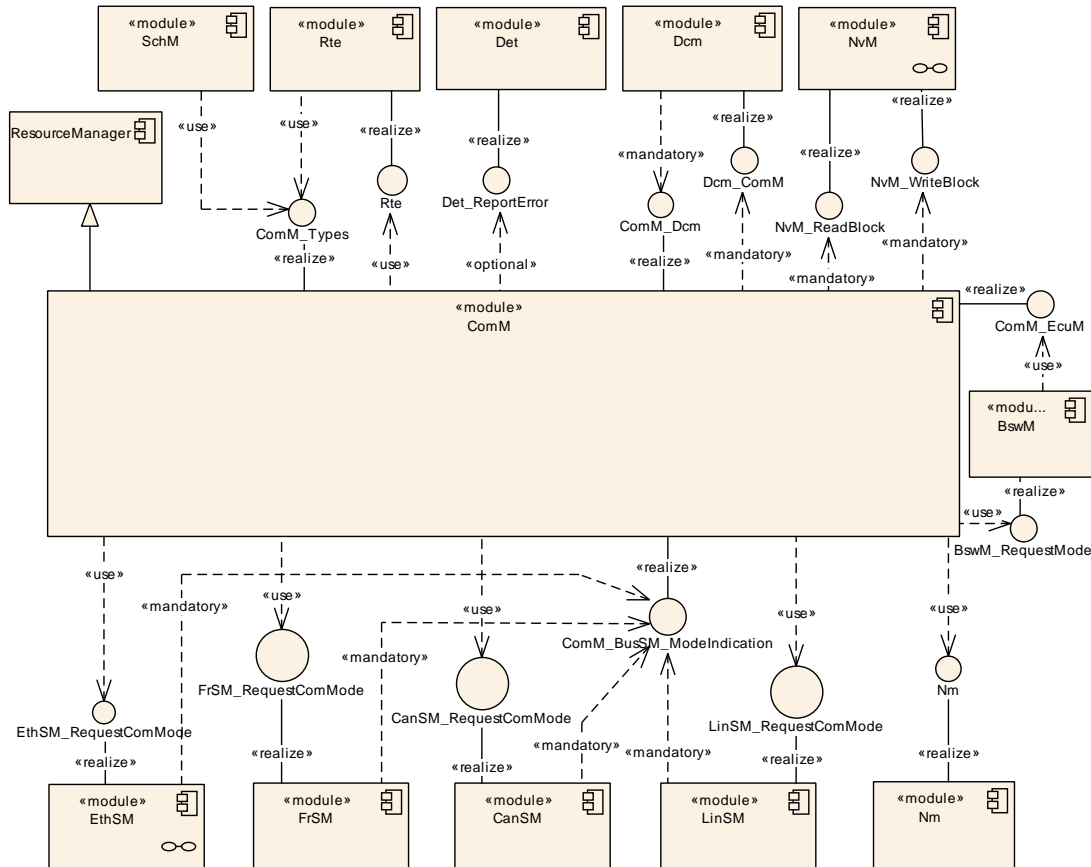

**Figure 5.1: Communication Manager Module context view**

The Communication Manager Module requests the communication capabilities, requested from the users, from the Bus State Manager modules.

## 5.1 File structure

## 5.2 AUTOSAR Runtime Environment (RTE)

Every user can request a Communication Mode. The RTE propagates the user request to the CoM module and the Communication Mode indications from the CoM to the users (for details refer to [7]).

## 5.3 ECU State Manager (EcuM)

EcuM is responsible to validate wake-up events and send an indication to ComM if a wake-up is validated.

Communication allowed and shutdown of ECU is handled by EcuM together with BswM. (see [3] for details)

## 5.4 Basic Software Mode Manager (BswM)

The BswM realizes two functionalities Mode Arbitration and Mode Control to allow the application of an Application Mode Management and a Vehicle Mode Management.

The BswM propagates user requests to the ComM module, if configured in the action lists of BswM to be able to request ComM modes via BswM.

The BswM controls the PDU Groups in the AUTOSAR Communication Module (COM), if the call of Com_IpduGroupControl is configured in the action list.

**[SWS_ComM_00976]**

  *Upstream requirements:* SRS_ModeMgm_09251

⌈ComM indicates all channel main state changes and all PNC state changes to the BswM.⌋

If EcuM-Flex is used, BswM will indicate to ComM if communication is allowed or not.

## 5.5 NVRAM Manager

The ComM module uses the NVRAM Manager to store and read non-volatile data. For details on initial values of the NVRAM data refer to Chapter 10.

*Comment:* The NVRAM Manager must be initialized after a power up or reset of the ECU. It must be initialized before ComM, as when ComM is initialized, ComM assumes that NVRAM is ready to be used, and that it can read back non-volatile configuration data. When ComM is de-initialized, it writes non-volatile data to NVRAM.

## 5.6 Diagnostic Communication Manager (DCM)

The DCM performs the scheduling of diagnostic PDUs. The DCM acts as a user by requesting Communication Mode `COMM_FULL_COMMUNICATION` via a "DCM_ActiveDiagnostic" indication if diagnostics shall be performed. The DCM does

not provide an API to start/stop sending and receiving but guarantees that the communication capabilities are according to the ComM module Communication Modes.

## 5.7 LIN State Manager

The LIN State Manager controls the actual states of the LIN bus that correspond to a Communication Mode of the ComM module. The ComM module requests a Communication Mode from the LIN State Manager and the LIN State Manager maps the Communication Mode to a bus state.

## 5.8 CAN State Manager

The CAN State Manager controls the actual states of the CAN bus that correspond to a Communication Mode of the ComM module. The ComM module requests a Communication Mode from the CAN State Manager and the CAN State Manager maps the Communication Mode to a bus state.

## 5.9 FlexRay State Manager

The FlexRay State Manager controls the actual states of the FlexRay bus that correspond to a Communication Mode of the ComM module. The ComM module requests a Communication Mode from the FlexRay State Manager and the FlexRay State Manager maps the Communication Mode to a bus state.

## 5.10 Ethernet State Manager

The Ethernet State Manager controls the actual states of the Ethernet bus that correspond to a Communication Mode of the ComM module. The ComM module requests a Communication Mode from the Ethernet State Manager and the Ethernet State Manager maps the Communication Mode to a bus state.

## 5.11 Network Management (NM)

The ComM module uses the NM to synchronize the control of communication capabilities across the network (synchronous start-up and shutdown). Additionally the status information about PNCs is exchanged via dedicated APIs between ComM and Nm.

## 5.12  Default Error Tracer (DET)

The DET (see [8])provides services for reporting development, runtime, and transient errors. (see Section 7.9)

# 6   Requirements Tracing

The following tables reference the requirements specified in [9] and [10] and links to the fulfillment of these. Please note that if column "Satisfied by" is empty for a specific requirement this means that this requirement is not fulfilled by this document.

| Requirement | Description | Satisfied by |
|---|---|---|
| **[SRS_BSW_00004]** | All Basic SW Modules shall perform a pre-processor check of the versions of all imported include files | [SWS_ComM_00418] |

**Table 6.1: Requirements Tracing**

# 7 Functional specification

The Communication Manager (ComM) module simplifies the resource management for the users, whereat users may be runnable entities, SW-Cs, the BswM (e.g. SW-C request via BswM) or DCM (communication needed to diagnostic purpose).

**[SWS_ComM_00867]**

Upstream requirements: SRS_ModeMgm_09083

⌈The ComM shall provide three different Communication Modes. The highest Communication Mode shall be `COMM_FULL_COMMUNICATION`. The lowest Communication Mode shall be `COMM_NO_COMMUNICATION`.⌋

**[SWS_ComM_00151]**

Upstream requirements: SRS_ModeMgm_09246

⌈For a user it shall only be possible to request the Communication Modes `COMM_NO_COMMUNICATION` and `COMM_FULL_COMMUNICATION` (see ComM_RequestComMode(), [SWS_ComM_00110]).⌋

Rationale for [SWS_ComM_00151]:

- The Communication Mode `COMM_SILENT_COMMUNICATION` and sub-modes/sub-states are only necessary for synchronization with AUTOSAR NM.

- The Communication Mode `COMM_FULL_COMMUNICATION_WITH_WAKEUP_REQUEST` is only necessary to request the lower layer to trigger a wake-up on the network (e.g. Ethernet hardware compliant to [2, OA TC10]). This mode could not be requested by a user.

**[SWS_ComM_00868]**

Upstream requirements: SRS_ModeMgm_09083

⌈The Communication Mode `COMM_SILENT_COMMUNICATION` shall only be used for network synchronization.⌋

Note: The possibility to request `COMM_SILENT_COMMUNICATION` mode is removed since release 2.0.

Comment:

- The ComM module allows querying the Communication Mode requested by a particular user (see ComM_GetRequestedComMode(), [SWS_ComM_00079]).

- The ComM module allows querying the actual Communication Mode of a channel if the user is assigned to channel(see ComM_GetCurrentComMode(), [SWS_ComM_00083])

- The ComM module allows querying for the current PNC mode if the user is assigned to a PNC (see ComM_GetCurrentPNCComMode(), [SWS_ComM_91002])

**[SWS_ComM_00845]**

    *Upstream requirements:* SRS_ModeMgm_09083

⌈In `COMM_FULL_COMMUNICATION` mode, the ComM module shall allow transmission and reception on the affected physical channel.⌋

**[SWS_ComM_00846]**

    *Upstream requirements:* SRS_ModeMgm_09083

⌈In `COMM_NO_COMMUNICATION` mode, the ComM module shall prevent transmission and reception on the affected physical channel.⌋

**[SWS_ComM_00686]**

    *Upstream requirements:* SRS_ModeMgm_09078

⌈If at least one of multiple independent user requests demands a higher Communication Mode (see [SWS_ComM_00867] and [SWS_ComM_00868]), the ComM module shall set this higher Communication Mode as the target Communication Mode.⌋

Rationale for [SWS_ComM_00686]: ComM coordinates multiple independent user requests according to the "highest wins" strategy: `COMM_FULL_COMMUNICATION` Communication Mode overrules `COMM_NO_COMMUNICATION`.

**[SWS_ComM_00500]**

    *Upstream requirements:* SRS_ModeMgm_09246

⌈The ComM module shall not queue user requests. The latest user request of the same user shall overwrite an old user request even if the request is not finished.⌋

**[SWS_ComM_00866]**

    *Upstream requirements:* SRS_ModeMgm_09083

⌈If configuration parameter ComMNmVariant=`FULL`|`LIGHT`|`NONE` ([ECUC_ComM_00568]), an DCM_ActiveDiagnostic indication shall be treated as a `COMM_FULL_COMMUNICATION` request for the specified communication channel (see ComM_DCM_ActiveDiagnostic(channel), [SWS_ComM_00873]).⌋

Rationale for [SWS_ComM_00866]: If more channels needed for diagnostic purpose, DCM needs to indicate DCM_ActiveDiagnostic for each channel.

**[SWS_ComM_00092]**

*Upstream requirements:* SRS_ModeMgm_09078, SRS_ModeMgm_09080, SRS_ModeMgm_-09083, SRS_ModeMgm_09172

⌈There shall be one Communication Mode target state (evaluated according to [SWS_ComM_00686]) per communication channel. This target mode can differ temporarily from the actual mode controlled by the corresponding Bus State Manager module.⌋

Comment: Mode switching by the corresponding Bus State Manager module takes time and a mode inhibition can be active.

**[SWS_ComM_00084]**

*Upstream requirements:* SRS_ModeMgm_09149

⌈The ComM module shall propagate a call of ComM_GetCurrentComMode() (see [SWS_ComM_00083]) to the Bus State Manager module(s) for the channel(s) the user are configured to (see also [SWS_ComM_00176] and [SWS_ComM_00798])⌋

Rationale for [SWS_ComM_00084]: State requests have to be propagated to the corresponding Bus State Manager module since the ComM module does not control the actual bus state.

Comment: This feature is not used by a "normal SW-C" because they don't have knowledge about channels. This feature is necessary for privileged SW-Cs, which (have to) know about the system topology, e.g. system diagnostic functions.

**[SWS_ComM_00884]** ⌈The ComM module shall store status if communication for a channel is allowed or not allowed in separate CommunicationAllowed boolean flags for all supported channels. The default value after ComM initialization shall be communication is not allowed, i.e. CommunicationAllowed is set to FALSE.⌋

**[SWS_ComM_00885]** ⌈Status changes for communication allowed or not allowed in [SWS_ComM_00884] shall be provided to ComM in `ComM_CommunicationAllowed (<channel>, TRUE|FALSE)` ([SWS_ComM_00871]) indications.⌋

## 7.1   Partial Network Cluster Management

The ComM offers users the option to wake and keep awake so-called "partial network cluster" (PNC). A PNC is a (logical) group of ECUs which have to be active at the same

time to realize some distributed functionality. If PNC-enabled gateways are used, a PNC can span the whole network (different busses on different topology levels of the network hierarchy). Without the PN functionality, NM messages can only wake and keep awake whole busses.

### 7.1.1 Overview

ComM implements a state machine for each partial network cluster (PNC) to represent the communication mode of a PNC.

Each PNC has its own state. The state definitions are related to the states of ComM for a simple mapping.

ComM users are used to request and release the PNCs.

The status of all PNCs on the nodes of a system channel is exchanged within the so-called PNC bit vector via a network management message (NM message).

Additional information regarding the partial network cluster functionality can be found in document Guide to Mode Management [11].

### 7.1.2 Partial Network Cluster Management Functionality

**[SWS_ComM_00910]**

*Upstream requirements:* SRS_ModeMgm_09243

⌈PNC functionality shall only exist if the parameter `ComMPncSupport` is set to TRUE. (see [ECUC_ComM_00839]).⌋

**[SWS_ComM_00911]**

*Upstream requirements:* SRS_ModeMgm_09243, SRS_ModeMgm_09245

⌈Enabling or disabling of the PNC functionality shall be post-build configurable using the parameter ComMPncEnabled (see [ECUC_ComM_00878]).⌋

Comment: The ComM module notifies the BswM about every state change of the PNC state machine by calling BswM_ComM_CurrentPncMode(). (refer to [SWS_ComM_00908])

**[SWS_ComM_00982]**

*Upstream requirements:* SRS_ModeMgm_09243

⌈For exchanging PNC status information between ComM and Nm, bit vectors shall be used. Such a bit vector is called "PNC bit vector" and contain a maximum of 504 bits.⌋

Comment: The PNC bit vector is provided as a reference to an array of type uint8 to the ComM within the dedicated APIs. Each bit in the PNC bit vector represents the status of a particular PNC. The bit is called "PNC bit".

### [SWS_ComM_00825]

*Upstream requirements:* SRS_ModeMgm_09243

⌈The byteIndex and bitIndex, in which a PNC bit corresponding to one `ComMPncId` resides, shall be determined as follows:

- byteIndex=(`ComMPncId` div 8) - <PNC Vector Offset>

- bitIndex=(`ComMPncId` mod 8)

⌋

Hint: The value of the PNC bit vector length of the corresponding channel can

be obtained from the configuration of the Network Management module.

Comment: [SWS_ComM_00825] defines only the calculation of the byteIndex and bitIndex, not how it shall be implemented.

ComM receives the aggregated state of internal and external PNC requests as PNC bit vector via the callback function ComM_Nm_UpdateEIRA(<PNC bit vector of internal and external PNC requests>).

### [SWS_ComM_01060]

*Upstream requirements:* SRS_ModeMgm_09248, SRS_ModeMgm_09250

⌈If ComM_Nm_UpdateEIRA(<PNC bit vector of EIRA>) is called, then ComM shall transfer the content of the given PNC bit vector to the EIRA of ComM with respect to the PNC bit vector length configured in NmIf.⌋

Note for [SWS_ComM_01060]: It is assumed that one buffer for the EIRA PNC bit vector per PNC is implemented. The length of this buffer should have the maximum length of the configured PNC bit vectors associated with the channels which are referenced by this PNC. For example, if PNC refer to ComMChannel A and ComMChannel B and the PNC bit vector length configured for those channels deviate (ChannelA-PncBitVectorLenth = 10Byte and ChannelB-PncBitVectorLength = 20), then one EIRA buffer for this PNC shall be available with PNC bit vector length set to 20 byte.

ComM receives the aggregated state of external PNC requests as PNC bit vector per channel via the callback function ComM_Nm_UpdateERA(<Channel>, <PNC bit vector of external PNC requests>).

**[SWS_ComM_01061]**

*Upstream requirements:* SRS_ModeMgm_09248, SRS_ModeMgm_09250, SRS_ModeMgm_-09249

⌈If the configuration parameter `ComMPncGatewayEnabled` (see [ECUC_ComM_00887]) is set to TRUE, ComM_Nm_UpdateERA(<channel>, <PNC bit vector of ERA>) is called and the parameter `ComMPncGatewayType` is set for the given channel, then ComM shall transfer the content of the given PNC bit vector to the ERA of ComM with respect to the given channel and the PNC bit vector length configured in NmIf.⌋

Note:

- ComM tranfers the EIRA PNC bit vector provided by Nm in one internal EIRA (see [SWS_ComM_01060]) and each ERA PNC bit vector in one ERA per `ComMChannel` (see [SWS_ComM_01061])

- Transferring the content of a PNC bit vector result in the internal EIRA / ERA of ComM by setting the PNC bit in the internal EIRA / ERA to '1' if the corresponding PNC bit in the PNC bit vector is set to '1' or setting the PNC bit in the internal EIRA / ERA to '0' if the corresponding PNC bit in the PNC bit vector is set to '0'

**[SWS_ComM_01062]**

*Upstream requirements:* SRS_ModeMgm_09248, SRS_ModeMgm_09250

⌈The ComM module shall be able to distribute the status of a particular PNC (result of the PNC state machine) across the assigned ComM channels. Therefore ComM shall forward the aggregated state of internal PNC request per communication channel (e.g. bus or network) as PNC bit vector by calling the API Nm_UpdateIRA(<channel>, <PNC bit vector of aggregated internal PNC requests>). The IRA PNC bit vector designates the status of the internal PNC requests.⌋

Note:

- The meaning of the PNC bits is defined in [[SWS_ComM_00825]]

- Internal PNC requests are based on ComM user PNC requests and/or PNC requests, due to PNC gateway handling

### 7.1.3 ComM PNC state machine

**[SWS_ComM_00953]**

*Upstream requirements:* SRS_ModeMgm_09243

⌈If the PNC functionality is enabled using the configuration parameter ComMPncEnabled set to TRUE (see [ECUC_ComM_00878]), all actions related to PNC changes

shall be executed before the channel related actions (channel related actions, see Chapter 7.3).⌋

### [SWS_ComM_00909]

*Upstream requirements:* SRS_ModeMgm_09247

⌈For every Partial Network Cluster, only one PNC state machine shall be implemented (i.e. one PNC state machine per PNC, independent of the amount of `ComMChannel`s).⌋

### [SWS_ComM_00920]

*Upstream requirements:* SRS_ModeMgm_09247

⌈The ComM module shall support up to 504 PNC state machines.⌋

### [SWS_ComM_00924]

*Upstream requirements:* SRS_ModeMgm_09247

⌈ The PNC state machine shall consist of the two main states `COMM_PNC_FULL_-COMMUNICATION` and `COMM_PNC_NO_COMMUNICATION`.⌋

### [SWS_ComM_00907]

*Upstream requirements:* SRS_ModeMgm_09247

⌈The PNC main state `COMM_PNC_FULL_COMMUNICATION` shall consist of the sub states `COMM_PNC_PREPARE_SLEEP`, `COMM_PNC_READY_SLEEP` and `COMM_PNC_RE-QUESTED`.⌋

### [SWS_ComM_00908]

*Upstream requirements:* SRS_ModeMgm_09251

⌈Every state change (listed within the `ComM_PncModeType`), excluding entering of the main state `COMM_PNC_NO_COMMUNICATION` coming from PowerOff, shall be notified by the API call BswM_ComM_CurrentPncMode() with the entered PNC state.⌋

### [SWS_ComM_00978]

*Upstream requirements:* SRS_ModeMgm_09247

⌈State transitions of the PNC state machines in ComM, triggered by a call to ComM_RequestComMode() shall be executed in the ComM_MainFunction_<Channel.ShortName> only.⌋

Comment: Every PNC activation triggers sending of the PNC bit vector n-times, thus it would increase the busload without debouncing.

**[SWS_ComM_00972]**

*Upstream requirements:* SRS_ModeMgm_09246

⌈The trigger "`ComMUser`" represents a notification about a communication request of a `ComMUser` by calling the API ComM_RequestComMode().⌋

**[SWS_ComM_00987]**

*Upstream requirements:* SRS_ModeMgm_09243

⌈Within the ComM_MainFunction_<Channel.ShortName> of a channel that is mapped to one or more PNCs, the requested state shall be handled in the following order:

1. ComM user requests of ComM users mapped to one or more PNCs of that channel

2. ComM user requests of ComM users mapped to that channel

3. ERA (if the configuration switch `ComMPncGatewayEnabled` is set to TRUE)

4. EIRA

⌋

Comment: Requests are handled in main functions of those channels they affect.

**[SWS_ComM_00827]**

*Upstream requirements:* SRS_ModeMgm_09243, SRS_ModeMgm_09246

⌈ComM channel requests originating from a PNC state machine shall be treated like user requests for the according channels. This includes impact on ComM channel state machine which comes along with "Communication allowed" (see CommunicationAllowed boolean flag) and "Communication inhibition")⌋

Note: Please refer to (see Section 7.4.1 for details regarding communication inhibition
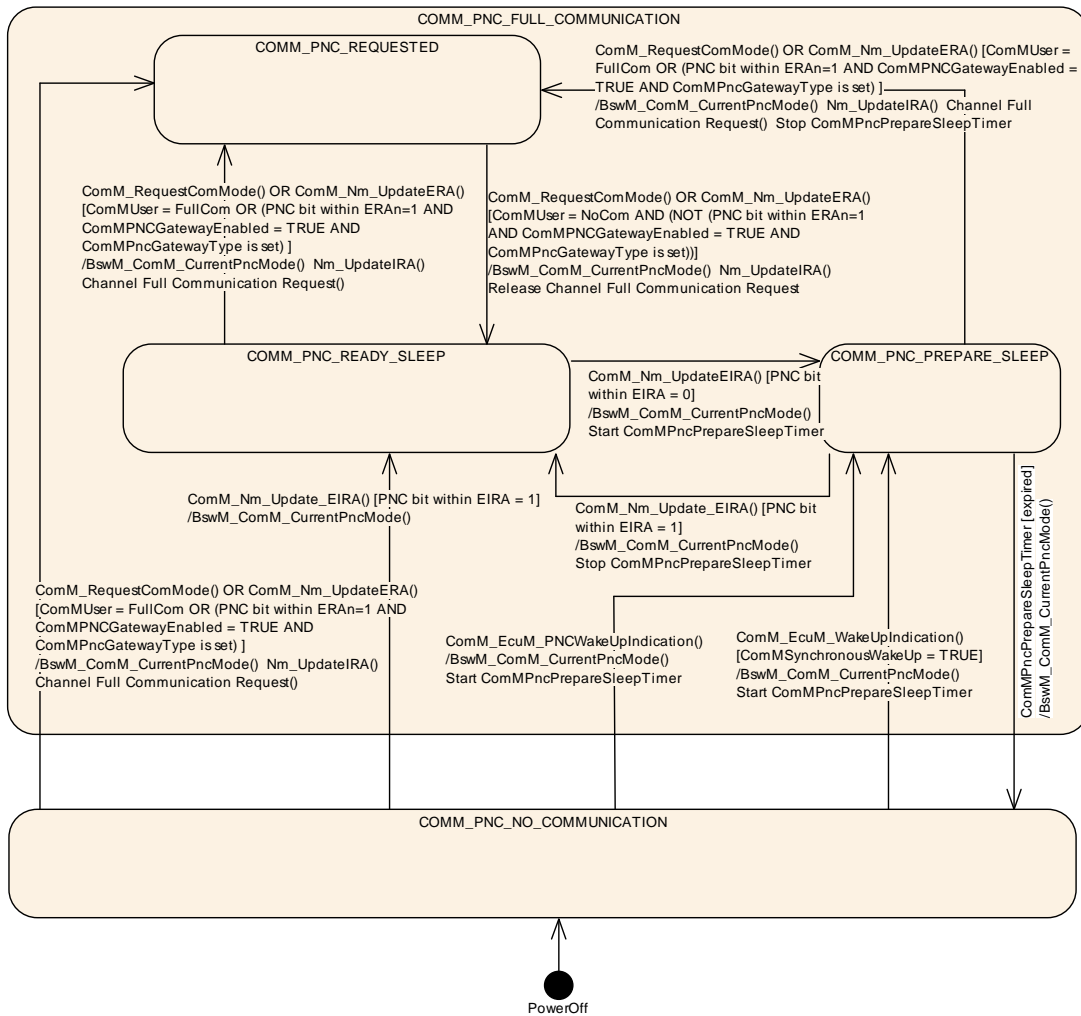

**Figure 7.1: PNC State Machine**

### 7.1.3.1 Behavior in PNC main state COMM_PNC_NO_COMMUNICATION

**[SWS_ComM_00926]**

*Upstream requirements:* SRS_ModeMgm_09243

⌈The PNC main state COMM_PNC_NO_COMMUNICATION shall be the default PNC state from power off.⌋

The main state COMM_PNC_NO_COMMUNICATION is the target state as long as the PNC is neither requested ECU internally nor requested externally.

**[SWS_ComM_01063]**

*Upstream requirements:* SRS_ModeMgm_09278

⌈If the API ComM_EcuM_WakeUpIndication() is called in PNC state `COMM_PNC_NO_-COMMUNICATION`, the configuration switch `ComMSynchronousWakeUp` is set to TRUE (see [ECUC_ComM_00695]) and for all PNCs that reference at least one `ComMChannel` via `ComMChannelPerPnc` (see [ECUC_ComM_00880]), the PNC main state `COMM_PNC_NO_COMMUNICATION` shall be left and the PNC sub state `COMM_PNC_-PREPARE_SLEEP` shall be entered.⌋

**[SWS_ComM_00990]**

*Upstream requirements:* SRS_ModeMgm_09278

⌈If the API ComM_EcuM_WakeUpIndication() is called in PNC state `COMM_PNC_NO_-COMMUNICATION`, and the configuration switch `ComMSynchronousWakeUp` is set to FALSE, the PNC main state `COMM_PNC_NO_COMMUNICATION` shall be the current state.⌋

Comment: In case of asynchronous wake up, the PNC state shall stay in `COMM_PNC_-NO_COMMUNICATION` until the PNC request is received (PNC bit in EIRA/ERAn is set to '1').

**[SWS_ComM_01064]**

*Upstream requirements:* SRS_ModeMgm_09278

⌈If the API ComM_EcuM_PNCWakeUpIndication(<PNC>) (see [SWS_ComM_91001]) is called in PNC state `COMM_PNC_NO_COMMUNICATION` and the indicated PNC reference at least one `ComMChannel` via `ComMChannelPerPnc` (see [ECUC_ComM_00880]), the PNC main state `COMM_PNC_NO_COMMUNICATION` shall be left and the PNC sub state `COMM_PNC_PREPARE_SLEEP` shall be entered.⌋

**[SWS_ComM_00932]**

*Upstream requirements:* SRS_ModeMgm_09246

⌈When at least one `ComMUser` assigned to this PNC requests "Full Communication" in PNC main state `COMM_PNC_NO_COMMUNICATION`, this state shall be left and the sub state `COMM_PNC_REQUESTED` of the main state `COMM_PNC_FULL_COMMUNICATION` shall be entered.⌋

**[SWS_ComM_01065]**

*Upstream requirements:* SRS_ModeMgm_09248

⌈When in main state `COMM_PNC_NO_COMMUNICATION` at least one PNC bit representing this PNC in EIRA changes to '1' and this PNC reference at least one `ComMChannel` via `ComMChannelPerPnc` (see [ECUC_ComM_00880]), the main state `COMM_-PNC_NO_COMMUNICATION` shall be left and the `COMM_PNC_READY_SLEEP` shall be entered.⌋

#### 7.1.3.1.1 PNC gateway related requirements

**[SWS_ComM_01066]**

*Upstream requirements:* SRS_ModeMgm_09257, SRS_ModeMgm_09249

⌈When in main state `COMM_PNC_NO_COMMUNICATION` at least one PNC bit representing this PNC in ERAn changes to '1', then the main state `COMM_PNC_NO_COMMUNICATION` shall be left and the sub state `COMM_PNC_REQUESTED` shall be entered under the following conditions:

- the parameter `ComMPncGatewayEnabled` (see [ECUC_ComM_00887]) is set to TRUE

- this PNC references at least one channel via `ComMChannelPerPnc` (see [ECUC_ComM_00880]) and all referenced channels have the `ComMPncGatewayType` set

⌋

Note: All the channels shall have GW type set which are referred by the PNC irrespective of the type of the reference i.e `ComMChannelPerPnc` or `ComMChannelPerTxOnlyPnc`.

#### 7.1.3.2 On entry of PNC main state `COMM_PNC_NO_COMMUNICATION` from PowerOff

Note: After switching on the power supply, main state `COMM_PNC_NO_COMMUNICATION` is entered from PowerOff (see [SWS_ComM_00926])

#### 7.1.3.3 Behavior in PNC main state `COMM_PNC_FULL_COMMUNICATION`

**[SWS_ComM_00929]**

*Upstream requirements:* SRS_ModeMgm_00049

⌈As long as a specific PNC is in state `COMM_PNC_FULL_COMMUNICATION` all `ComMChannel`s which are referenced by this PNC via `ComMChannelPerPnc` (see [ECUC_ComM_00880]) shall be in `COMM_FULL_COMMUNICATION`.⌋

### 7.1.3.4 On entry of PNC sub state COMM_PNC_REQUESTED

**[SWS_ComM_01067]**

*Upstream requirements:* SRS_ModeMgm_09268

⌈When entering the PNC sub state COMM_PNC_REQUESTED from COMM_PNC_NO_COM or COMM_PNC_PREPARE_SLEEP, this PNC reference at least one ComMChannel via ComMChannelPerPnc (see [ECUC_ComM_00880]) and ComMPncWakeupSleepRequestEnabled of this PNC is set to TRUE, BswM_ComM_CurrentPNCMode shall be called with COMM_PNC_REQUESTED_-WITH_WAKEUP_REQUEST, instead of calling BswM_ComM_CurrentPNCMode with COMM_PNC_REQUESTED.⌋

Note: Notification towards the BswM with COMM_PNC_REQUESTED_WITH_WAKEUP_-REQUEST is used for Ethernet switch port switching to trigger a wake-up on the network where the used Ethernet hardware is compatible to the OA TC10 (see [2])

**[SWS_ComM_01068]**

*Upstream requirements:* SRS_ModeMgm_09248, SRS_ModeMgm_09249

⌈When entering the PNC sub state COMM_PNC_REQUESTED, then the ComM module shall set the PNC bit with value '1' of the PNC bit representing this PNC within the IRA and forward the aggregated internal PNC requests to each channel which is referenced this PNC by calling Nm_UpdateIRA(<channel>, <IRA>) under either of the following conditions:

- ComMPncGatewayEnabled is set to FALSE

- ComMPncGatewayType is not set on any of the ComMChannels referenced by this PNC

⌋

**[SWS_ComM_01069]**

*Upstream requirements:* SRS_ModeMgm_00049

⌈Every time the sub state COMM_PNC_REQUESTED is entered from other states, ComM shall request COMM_FULL_COMMUNICATION for all configured ComM channels which are referenced by this PNC via parameter ComMChannelPerPnc (see [ECUC_ComM_00880]) and where ComMWakeupSleepRequestEnabled is set to FALSE or not available, even if the channel is already requested.⌋

**[SWS_ComM_01070]**

*Upstream requirements:* SRS_ModeMgm_09268

⌈Every time the sub state COMM_PNC_REQUESTED is entered from COMM_PNC_NO_COM or COMM_PNC_PREPARE_SLEEP, ComM shall request

`COMM_FULL_COMMUNICATION_WITH_WAKEUP_REQUEST` for all configured ComM channels which are referenced by this PNC via parameter `ComMChannelPerPnc` (see [ECUC_ComM_00880]) and where `ComMWakeupSleepRequestEnabled` is set to TRUE, even if the channel is already requested.⌋

**[SWS_ComM_01071]**

*Upstream requirements:* SRS_ModeMgm_09268, SRS_ModeMgm_00049

⌈Every time the sub state `COMM_PNC_REQUESTED` is entered from `COMM_PNC_-READY_SLEEP`, ComM shall request `COMM_FULL_COMMUNICATION` for all configured ComM channels which are referenced by this PNC via parameter `ComMChannelPerPnc` (see [ECUC_ComM_00880]) and where `ComMWakeupSleepRequestEnabled` is set to TRUE, even if the channel is already requested.⌋

Comment on [SWS_ComM_01071]: Entering from `COMM_PNC_READY_SLEEP` should not result in a wake-up on the network, since the PNC is already requested remotely by another ECU

### 7.1.3.4.1 PNC gateway related requirements

**[SWS_ComM_01072]**

*Upstream requirements:* SRS_ModeMgm_09248, SRS_ModeMgm_09249

⌈When entering the PNC sub state `COMM_PNC_REQUESTED` and `ComMPncGatewayEnabled` is set to TRUE, then ComM shall set the PNC bit with value '1' of the PNC bit representing this PNC within the IRA on all referenced `ComMChannel`s where `ComMPncGatewayType` is set to `COMM_GATEWAY_TYPE_ACTIVE` and forward the aggregated internal PNC request accordingly to those `ComMChannel`s by calling Nm_UpdateIRA(<channel>, <IRA>)⌋

### 7.1.3.5 Behavior in PNC sub state `COMM_PNC_REQUESTED`

**[SWS_ComM_00938]**

*Upstream requirements:* SRS_ModeMgm_09246

⌈When all `ComMUser`s assigned to this PNC request "No Communication", the sub state `COMM_PNC_REQUESTED` shall be left and the sub state `COMM_PNC_READY_-SLEEP` shall be entered, if `ComMPncGatewayEnabled` is set to FALSE or `ComMPncGatewayType` is not set on all channels which are referenced by this PNC.⌋

Note: As long as at least one `ComMUser` assigned to this PNC requests "Full Communication", `COMM_PNC_REQUESTED` will be the current PNC state. Please refer to the following requirements.

**[SWS_ComM_01073]**

*Upstream requirements:* SRS_ModeMgm_09256

⌈In sub state `COMM_PNC_REQUESTED` when `ComMPncGatewayEnabled` is set to FALSE and at least one `ComMUser` assigned to a specific PNC requests "Full Communication", then ComM shall request `COMM_FULL_COMMUNICATION` of those `ComMChannel`s which are referenced via `ComMChannelPerTxOnlyPnc` by this PNC.⌋

**[SWS_ComM_01074]**

*Upstream requirements:* SRS_ModeMgm_09256

⌈In sub state `COMM_PNC_REQUESTED` when `ComMPncGatewayEnabled` is set to FALSE and all `ComMUser`s assigned to a specific PNC requests "No Communication", then ComM shall request `COMM_NO_COMMUNICATION` of those `ComMChannel`s which are referenced via `ComMChannelPerTxOnlyPnc` by this PNC.⌋

#### 7.1.3.5.1 PNC gateway related requirements

**[SWS_ComM_00991]**

*Upstream requirements:* SRS_ModeMgm_09246

⌈The sub state `COMM_PNC_REQUESTED` shall be left and the sub state `COMM_PNC_-READY_SLEEP` shall be entered under the following conditions:

- all `ComMUser`s assigned to this PNC request "No Communication"

- the parameter `ComMPncGatewayEnabled` is set to TRUE

- at least one `ComMChannel` is referenced via `ComMChannelPerPnc` (see [ECUC_ComM_00880]) by this PNC

- all `ComMChannel`s referenced by this PNC have `ComMPncGatewayType` parameter set

- the PNC bit representing this PNC equals to '0' in ERAn

⌋

**[SWS_ComM_01075]**

*Upstream requirements:* SRS_ModeMgm_09246, SRS_ModeMgm_09249

⌈The sub state `COMM_PNC_REQUESTED` shall be left and the sub state `COMM_PNC_-READY_SLEEP` shall be entered under the following conditions:

- all `ComMUser`s assigned to this PNC request "No Communication"

- the parameter `ComMPncGatewayEnabled` is set to TRUE

- all `ComMChannel`s referenced by this PNC have `ComMPncGatewayType` parameter NOT set

⌋

### [SWS_ComM_01076]

*Upstream requirements:* SRS_ModeMgm_09256

⌈In sub state `COMM_PNC_REQUESTED` when `ComMPncGatewayEnabled` is set to TRUE and at least one `ComMUser` assigned to a specific PNC requests "Full Communication", then ComM shall set the PNC bit representing this specific PNC to value '1' within the IRA of those `ComMChannel`s

- which have `ComMPncGatewayType` parameter set to `COMM_GATEWAY_TYPE_-PASSIVE` and

- referenced either via `ComMChannelPerPnc` or via `ComMChannelPerTxOnlyPnc` by this PNC,

and forward the updated IRA with a call of Nm_UpdateIRA(<channel>, <IRA>).⌋

### [SWS_ComM_01077]

*Upstream requirements:* SRS_ModeMgm_09256

⌈In sub state `COMM_PNC_REQUESTED` when `ComMPncGatewayEnabled` is set to TRUE and the PNC bit representing a specific PNC equals to '1' in at least one ERA, whose corresponding `ComMChannel` has the `ComMPncGatewayType` parameter set to `COMM_GATEWAY_TYPE_ACTIVE`, then ComM shall set the PNC bit representing this specific PNC to value '1' within the IRA of those `ComMChannel`s

- which have `ComMPncGatewayType` parameter set to `COMM_GATEWAY_TYPE_-PASSIVE` and

- referenced via `ComMChannelPerPnc` or via `ComMChannelPerTxOnlyPnc` by this PNC,

and forward the updated IRA with a call of Nm_UpdateIRA(<channel>, <IRA>).⌋

### [SWS_ComM_01078]

*Upstream requirements:* SRS_ModeMgm_09256

⌈In sub state `COMM_PNC_REQUESTED` when `ComMPncGatewayEnabled` is set to TRUE and at least one `ComMUser` assigned to a specific PNC requests "Full Communication", then ComM shall request `COMM_FULL_COMMUNICATION` of those `ComMChannel`s which are referenced via `ComMChannelPerTxOnlyPnc` by this PNC.⌋

**[SWS_ComM_01079]**

*Upstream requirements:* SRS_ModeMgm_09256, SRS_ModeMgm_09250

⌈In sub state `COMM_PNC_REQUESTED` when `ComMPncGatewayEnabled` is set to TRUE, if

- all `ComMUser`s assigned to a specific PNC request "No Communication" and
- the PNC bit representing this specific PNC equals to '0' in ERAn, whose corresponding `ComMChannel` has the `ComMPncGatewayType` parameter set to `COMM_GATEWAY_TYPE_ACTIVE`,

then ComM shall set the PNC bit representing this specific PNC to value '0' within

the IRA of those `ComMChannel`s

- which have `ComMPncGatewayType` parameter set to `COMM_GATEWAY_TYPE_-PASSIVE` and
- which are referenced via `ComMChannelPerPnc` or via `ComMChannelPerTxOnlyPnc` by this PNC,

and forward the updated IRA with a call of Nm_UpdateIRA(<channel>, <IRA>).⌋

**[SWS_ComM_01080]**

*Upstream requirements:* SRS_ModeMgm_09256, SRS_ModeMgm_09250

⌈In sub state `COMM_PNC_REQUESTED` when `ComMPncGatewayEnabled` is set to TRUE, if

- all `ComMUser`s assigned to a specific PNC request "No Communication" and
- the `ComMChannel`s which are referenced by this PNC have the `ComMPncGatewayType` parameter not set,

then ComM shall set the PNC bit representing this specific PNC to value '0' within

the IRA of all `ComMChannel`s which are referenced by this PNC and forward the updated IRA with a call of Nm_UpdateIRA(<channel>, <IRA>)⌋

**[SWS_ComM_01081]**

*Upstream requirements:* SRS_ModeMgm_09256, SRS_ModeMgm_09250

⌈In sub state `COMM_PNC_REQUESTED` when `ComMPncGatewayEnabled` is set to TRUE and all `ComMUser`s assigned to a specific PNC request "No Communication", then ComM shall request `COMM_NO_COMMUNICATION` of those `ComMChannel`s which are referenced via `ComMChannelPerTxOnlyPnc` by this PNC.⌋

**[SWS_ComM_01082]**

*Upstream requirements:* SRS_ModeMgm_09269

⌈When a request to forward a synchronized PNC shutdown has been indicated via a call of ComM_Nm_ForwardSynchronizedPncShutdown(<channel>, <PNC bit vector>) in sub-state `COMM_PNC_REQUESTED` and all following conditions apply:

- all ComM users assigned to this PNC request "No Com",

- all corresponding PNC bits are set to '0' in ERAn of all channels which are referenced by this PNC via `ComMChannelPerPnc` (see [ECUC_ComM_00880]) where the channel attribute `ComMPncGatewayType` is set to `COMM_GATEWAY_TYPE_ACTIVE`,

- the PNC is indicated for a shutdown (PNC bit set to '1' in the given PNC bit vector) within the call of `ComM_Nm_ForwardSynchronizedPncShutdown`

- the indicated channel has `ComMPncGatewayType` set to `COMM_GATEWAY_TYPE_PASSIVE` and the channel is referenced via `ComMChannelPerPnc` (see [ECUC_ComM_00880]),

- `ComMSynchronizedPncShutdownEnabled` is set to TRUE,

then the ComM module shall perform the following actions:

- ComM shall set the ERA bit to '0' of this PNC in the ERA of all channels which are referenced by this PNC via `ComMChannelPerPnc` (see [ECUC_ComM_00880]) where the channel attribute `ComMPncGatewayType` is set to `COMM_GATEWAY_TYPE_PASSIVE`

- ComM shall call Nm_RequestSynchronizedPncShutdown (<channel>, <PncId>) for each <channel> with <PncId> of the current handled PNC, where `ComMPncGatewayType` is set to "`COMM_GATEWAY_TYPE_ACTIVE`" and the channel is referenced via `ComMChannelPerPnc` (see [ECUC_ComM_00880])

- The sub state `COMM_PNC_REQUESTED` shall be left and the sub state `COMM_PNC_READY_SLEEP` shall be entered

⌋

Comment on [[SWS_ComM_01082]]:

- Every time an intermediate PNC coordinator (PNC coordinator which have at least one `ComMChannel` with `ComMPncGatewayType` set to `COMM_GATEWAY_TYPE_PASSIVE`) receive a Nm frame as PN shutdown message from the top-level PNC coordinator, ComM shall immediately release the PNC, forward the PNC bit vector of the PN shutdown message and request a synchronized PNC shutdown (request to transmit a PN shutdown message) on those `ComMChannel`s which are are assigned to the affected PNC and where `ComMPncGatewayType` is set to `COMM_GATEWAY_TYPE_ACTIVE`

- ComM has to ensure that the procedure upon the reception of Nm frame as PN shutdown message has to be performed as fast as possible, to minimize the delay of the synchronized PNC shutdown

- The forwarding of a synchronized PNC shutdown is not performed if a local user has indicated to request the affected PNC, or a PNC request was received via a ComM channel with `ComMPncGatewayType` set to `COMM_GATEWAY_TYPE_-ACTIVE`. The request for a PNC either local requested or remotely requested always overrule a request for a synchronized PNC shutdown.

- Synchronized PNC shutdown handling is only performed if the indicated PNCs (given within the PNC bit vector) reside in `COMM_PNC_REQUESTED`

**[SWS_ComM_01097]**

   *Upstream requirements:* SRS_ModeMgm_09269

⌈If a request to forward a synchronized PNC shutdown has been indicated via a call of ComM_Nm_ForwardSynchronizedPncShutdown(<channel>) for this PNC, the PNC is qualified to be released and the precondition to forward the synchronized PNC request are not fulfilled (see [SWS_ComM_01082]), then the ComM module shall reject to perform the forwarding of a synchronized PNC shutdown and if `ComMPncN-mRequest` is set to TRUE, then ComM shall request the network again by invoking Nm_NetworkRequest for all `ComMChannel`s which are assigned to this PNC, even though the current state of an affected channel is already "Full communication"⌋

**[SWS_ComM_01083]**

   *Upstream requirements:* SRS_ModeMgm_09269, SRS_ModeMgm_09249

⌈If `ComMSynchronizedPncShutdownEnabled` is set to TRUE and `ComMPncGate-wayType` set to `COMM_GATEWAY_TYPE_ACTIVE` on all ComM channels assigned to this PNC, the API Nm_RequestSynchronizedPncShutdown (<channel>, <PncId>) shall be called, whereat <channel> represent the current handled `ComMChannel` and <PncId> the `ComMPncId` of this PNC under the following conditions:

- corresponding PNC bit in ERAn is equal to "0"

- all `ComMUser`s assigned to this PNC request "No Communication"

- The channel is referenced via `ComMChannelPerPnc` (see [ECUC_ComM_00880]) by this PNC

⌋

Comment on [SWS_ComM_01083]: Everytime a PNC is released, synchronized PNC shutdown is configured and the ECU act as a top-level PNC coordinator for this PNC, a PN shutdown message has to be transmitted on the affected `ComMChannel`s. Therefore ComM forward the PNC bit vector regarding the detection of a released PNC to NmIf by calling Nm_RequestSynchronizedPncShutdown for each `ComMChannel` the

PNC is assigned to. NmIf is forwarding the call to the affected <Bus>Nm. The PN shutdown message is transmitted within the <Bus>Nm_Mainfunction.

**[SWS_ComM_01084]**

 *Upstream requirements:* SRS_ModeMgm_09256

⌈In sub state `COMM_PNC_REQUESTED` if ComM0PncVectorAvoidance is set to TRUE and all PNC bits in the calculated IRA of a `ComMChannel` referenced via `ComMChannelPerPnc` (see [ECUC_ComM_00880]) are set to '0', the ComM module shall release this `ComMChannel`. As soon as at least one bit in the IRA changes back to '1' again, the ComM module shall request this `ComMChannel` again.⌋

Comment on [SWS_ComM_01084]: As long as a PNC is requested remotely (i.e. at least one PNC bit within ERAn assigned to this PNC equals '1') and the configuration switch `ComMPncGatewayEnabled` is set to TRUE, `COMM_PNC_REQUESTED` will be the current PNC state.

### 7.1.3.6 On entry PNC sub state `COMM_PNC_READY_SLEEP`

**[SWS_ComM_01085]**

 *Upstream requirements:* SRS_ModeMgm_09248, SRS_ModeMgm_09250

⌈When entering the PNC sub state `COMM_PNC_READY_SLEEP` from `COMM_PNC_REQUESTED`, then the PNC bit representing this PNC within the IRA shall be set to value '0' and the aggregated internal PNC requests shall be forwarded to each channel which is referenced by this PNC by calling Nm_UpdateIRA(<channel>, <IRA>)⌋

**[SWS_ComM_01086]**

 *Upstream requirements:* SRS_ModeMgm_00049

⌈When entering the PNC sub state `COMM_PNC_READY_SLEEP` from `COMM_PNC_REQUESTED`, ComM shall release the `COMM_FULL_COMMUNICATION` request for all configured ComM channels referenced via `ComMChannelPerPnc` (see [ECUC_ComM_00880]) by this PNC⌋

### 7.1.3.7 Behavior in PNC sub state `COMM_PNC_READY_SLEEP`

As long as the PNC is requested (i.e. the PNC bit representing this PNC within EIRA equals '1') and no `ComMUser` assigned to this PNC requests "Full Communication", `COMM_PNC_READY_SLEEP` will be the current state.

**[SWS_ComM_00940]**

*Upstream requirements:* SRS_ModeMgm_09248

⌈If the PNC is released (i.e. the PNC bit representing this PNC within EIRA equals '0'), the sub state `COMM_PNC_READY_SLEEP` shall be left and the sub state `COMM_PNC_-PREPARE_SLEEP` shall be entered.⌋

**[SWS_ComM_01087]**

*Upstream requirements:* SRS_ModeMgm_09246, SRS_ModeMgm_09247, SRS_ModeMgm_-09248

⌈The sub state `COMM_PNC_READY_SLEEP` shall be left and the sub state `COMM_PNC_-REQUESTED` shall be entered if at least one `ComMUser` assigned to this PNC requests "Full Communication".⌋

#### 7.1.3.7.1 PNC gateway related requirement

**[SWS_ComM_01088]**

*Upstream requirements:* SRS_ModeMgm_09248

⌈When in sub state `COMM_PNC_READY_SLEEP` at least one PNC bit representing this PNC in ERAn changes to '1', the sub state `COMM_PNC_READY_SLEEP` shall be left and the sub state `COMM_PNC_REQUESTED` shall be entered under the following conditions:

- the parameter `ComMPncGatewayEnabled` (see [ECUC_ComM_00887]) is set to TRUE,
- this PNC references at least one channel via `ComMChannelPerPnc` (see [ECUC_ComM_00880]) and the referenced channels have the `ComMPncGatewayType` set

⌋

#### 7.1.3.8 On entry of PNC sub state `COMM_PNC_PREPARE_SLEEP`

**[SWS_ComM_00952]**

*Upstream requirements:* SRS_ModeMgm_09279

⌈If the sub state `COMM_PNC_PREPARE_SLEEP` is entered, the timer `ComMPncPrepareSleepTimer` (see [ECUC_ComM_00841]) shall be started with the configured initial value.⌋

### 7.1.3.9 Behavior in PNC sub state `COMM_PNC_PREPARE_SLEEP`

As long as the timer `ComMPncPrepareSleepTimer` (see [ECUC_ComM_00841]) is running and no changes in `ComMUser`, EIRA or ERAn occur, `COMM_PNC_PREPARE_SLEEP` will be the current state.

**[SWS_ComM_00947]**

*Upstream requirements:* SRS_ModeMgm_09279

⌈When the timer `ComMPncPrepareSleepTimer` (see [ECUC_ComM_00841]) expires, the PNC sub state `COMM_PNC_PREPARE_SLEEP` shall be left and the PNC main state `COMM_PNC_NO_COMMUNICATION` shall be entered.⌋

**[SWS_ComM_00948]**

*Upstream requirements:* SRS_ModeMgm_09246

⌈When in `COMM_PNC_PREPARE_SLEEP` at least one `ComMUser` assigned to this PNC requests "Full Communication", the `COMM_PNC_PREPARE_SLEEP` state shall be left. The timer `ComMPncPrepareSleepTimer` shall be stopped and the sub state `COMM_PNC_REQUESTED` state shall be entered.⌋

**[SWS_ComM_00950]**

*Upstream requirements:* SRS_ModeMgm_09246

⌈When in `COMM_PNC_PREPARE_SLEEP` the PNC bit representing this PNC within EIRA changes to '1' and this PNC references at least one channel via `ComMChannelPerPnc` (see [ECUC_ComM_00880]), the sub state `COMM_PNC_PREPARE_SLEEP` shall be left. The timer `ComMPncPrepareSleepTimer` shall be stopped and the sub state `COMM_PNC_READY_SLEEP` shall be entered.⌋

#### 7.1.3.9.1 PNC gateway related requirements

**[SWS_ComM_01089]**

*Upstream requirements:* SRS_ModeMgm_09248, SRS_ModeMgm_09249

⌈When in sub state `COMM_PNC_PREPARE_SLEEP` at least one PNC bit representing this PNC in ERAn changes to '1', then sub state `COMM_PNC_PREPARE_SLEEP` shall be left, `COMM_PNC_REQUESTED` shall be entered and timer `ComMPncPrepareSleepTimer` shall be stopped under the following conditions:

- the parameter `ComMPncGatewayEnabled` (see [ECUC_ComM_00887]) is set to TRUE,

- this PNC references at least one channel via `ComMChannelPerPnc` (see [ECUC_ComM_00880]) and the referenced channels have the `ComMPncGatewayType` set

⌋

### 7.1.4 PNC Gateway

The PNC Gateway feature is used to span (logical) partial network clusters across bus / communication channel boundaries, "gatewaying" PNC requests from one bus/network to the others. (Therefore, for a PNC gateway to exist, it needs to be connected to multiple physical channels.)

To do so, the PNC gateway configuration contains information for each PNC which physical channels are required to reach all members of that PNC (PNC-to-channel-mapping, see Figure 7.2).

The PNC gateway collects PNC requests from all of its multiple active channels (which are called active since it actively keeps them awake, if required) and aggregates them. The PNC gateway sends the aggregated PNC state in the network to all its active channels, which causes all nodes to have the same view on the global PNC request state as the gateway.

If the PNC gateway is not the topmost PNC gateway in the network hierarchy, the PNC gateway will also send the aggregated PNC request state of all subordinate nodes, plus its own internal request state, to its superior PNC coordinator, which is connected via the so-called "passive" channel (which is called passive because it's the opposite of active).

The superior PNC coordinators will aggregate the subordinate coordinators' PNC request states, so the top level coordinator will know about all active PNC requests in the network, and send that info to the subordinate nodes.

Subordinate PNC coordinators forward the PNC request information received on their passive channel to their active channels to distribute the top level coordinators holistic view of the PNC request state to all leaf nodes in the logical hierarchy, so every node in the system is on the same page regarding the PNC request state.

A PNC coordinator must never aggregate and send back the information received via its passive channel in order not to create an endless mirroring loop of "phantom PNC requests".

| | PNC 1 | PNC 2 | PNC 3 | (...) |
|---|---|---|---|---|
| Bus X | x | | x | |
| Bus Y | x | x | | |
| (...) | | | | |
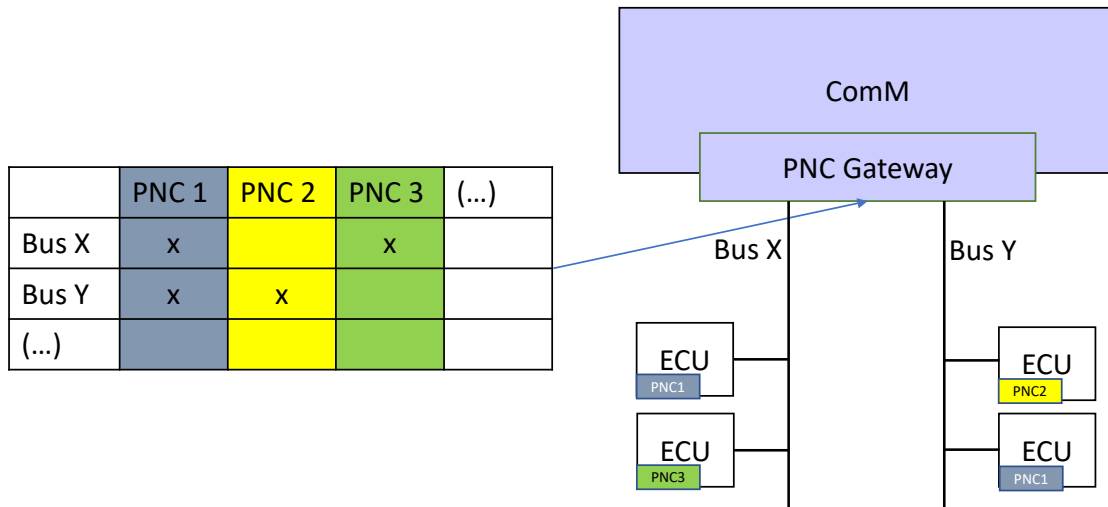

**Figure 7.2: PNC-to-channel-mapping**

The PNC to channel mapping is provided statically by configuration. Additionally, the optional feature Dynamic PNC-to-channel-mapping (see chapter 7.5) could be used to extend the PNC-to-channel mapping during run-time.

Note that when PNC Gateway is active and even if a PNC is only assigned to one channel, coordination might occur when request comes in from another channel where PNC is not assigned to. This is intended as there might be only PNC-requestor on the other channel which is not interested in being kept awake by this PNC.

### 7.1.4.1 Support for not coordinated PNCs assigned to multiple channels

Comment: When a Partial Network is assigned to more than one `ComMChannel` than this PNC is coordinated either on all affected `ComMChannel`s or not at all (see [12, System Template] [constr_5094]).

Note: If PNCs are assigned to different `ComMChannel`s and those `ComMChannel`s are not coordinated by a PNC gateway, then the network topology and communication design has to ensure, that the affected `ComMChannel`s are requested and released to the same point in time. If PNCs are used, an application should not care about `ComMChannel` states, and additionally, ComM will not take care about `ComMChannel` states for this use case, since the PNC coordination for those `ComMChannel`s is not performed. Or in other words, if a PNC is requested (passively) then also all referenced `ComMChannel`s shall be requested (passively), because an application expects that all `ComMChannel`s assigned to this PNCs reside in `COMM_FULL_COMMUNICATION`.

Figure 7.3 depict an example for a PNC gateway (Node2) with not coordinated `ComM-Channel`s
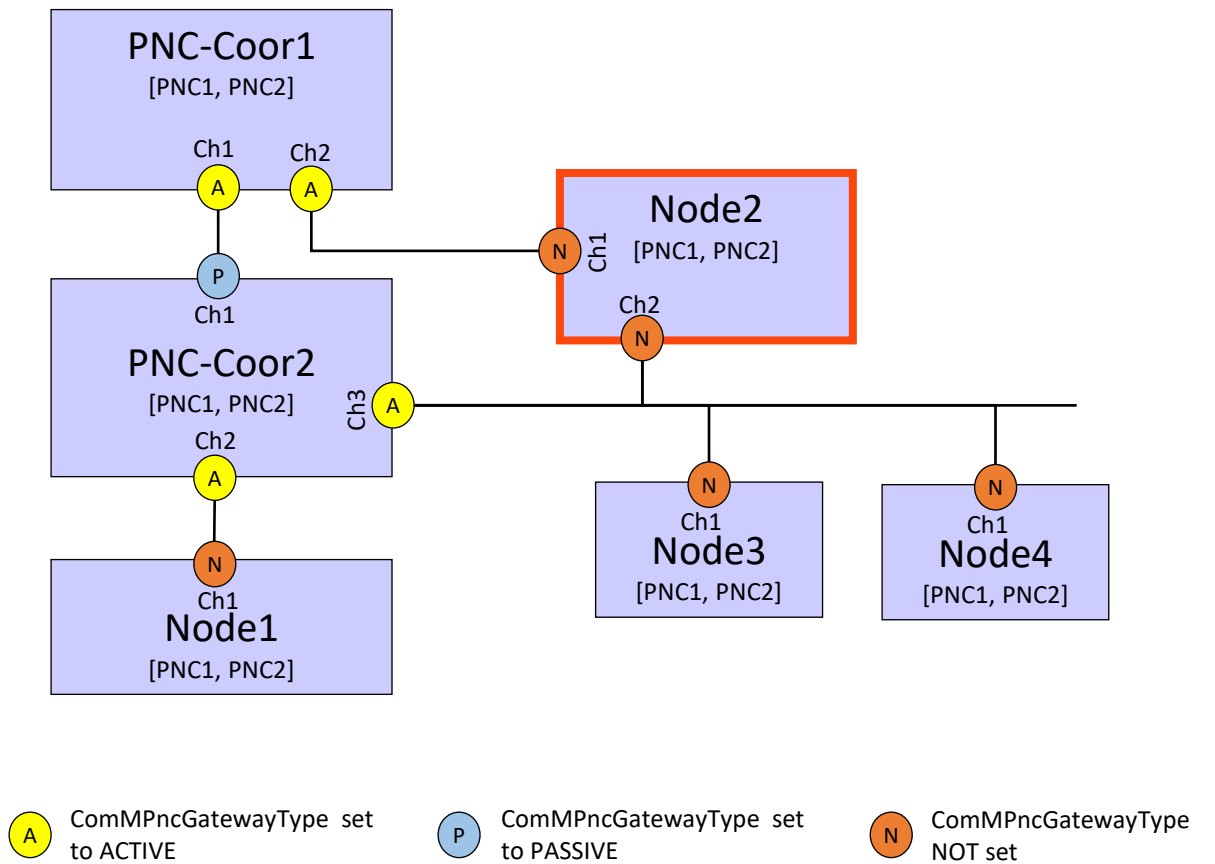

**Figure 7.3: Example for a PNC gateway with not coordinated `ComMChannel`s (see Node2)**

### 7.1.4.2 Active PNC Gateway

Note: Even if the configuration parameter `ComMPncGatewayEnabled` (see [ECUC_ComM_00887]) is TRUE and the parameter `ComMPncGatewayType` is set to `COMM_GATEWAY_TYPE_ACTIVE` for a `ComMChannel` (see [ECUC_ComM_00842]), the active PNC gateway still behaves as shown in Figure 7.1 "PNC State Machine".

Comment: An active PNC gateway on a system channel shall be the last node on a system channel that releases a PNC.

Comment: If the PNC bit for a PNC is equal to zero in all ERAn, no other node than the PNC gateway is requesting the PNC.

### 7.1.4.3 Passive PNC Gateway

Comment: The passively coordinated channels exist only if they are connected to more than one PNC gateway. If the PNC gateway functionality of ComM is enabled (`ComMPncGatewayEnabled` is set to TRUE) ComM channels mapped to this PNC gateway

can be set to type active or passive (`COMM_GATEWAY_TYPE_ACTIVE` or `COMM_GATE-WAY_TYPE_PASSIVE`). If a ComM channel is mapped to two different PNC gateways, only one gateway coordinates this channel actively, while the other passively. That means, a PNC gateway is always mapped to at least one ComM channel type active and may be mapped to one or some ComM channels type passive.

Comment: A PNC gateway requests the PNC if a local ComM user requests the PNC or at least one PNC bit within ERA originate from the actively coordinated system channels of a passive PNC gateway is not equal to 0.

Comment to [SWS_ComM_01079] and [SWS_ComM_01080]: A PNC gateway calculates the PNCs bit value in the ERA Tx PNC bit vectors to be sent for a passively coordinated channel, in the same manner as the PNC bit value in ERA for an actively coordinated channel, but sets the PNC's bit to '0' according to the rules of [SWS_ComM_01079] and [SWS_ComM_01080].

### 7.1.4.4 Synchronized PNC shutdown

A PN topology always reflects a hierarchical topology, where the so-called top-level PNC coordinator is located on the highest level. On the subordinated levels multiple so-called intermediate PNC coordinators and PNC leaf nodes could reside.

| A | ComMPncGatewayType set to ACTIVE | P | ComMPncGatewayType set to PASSIVE | N | ComMPncGatewayType NOT set |
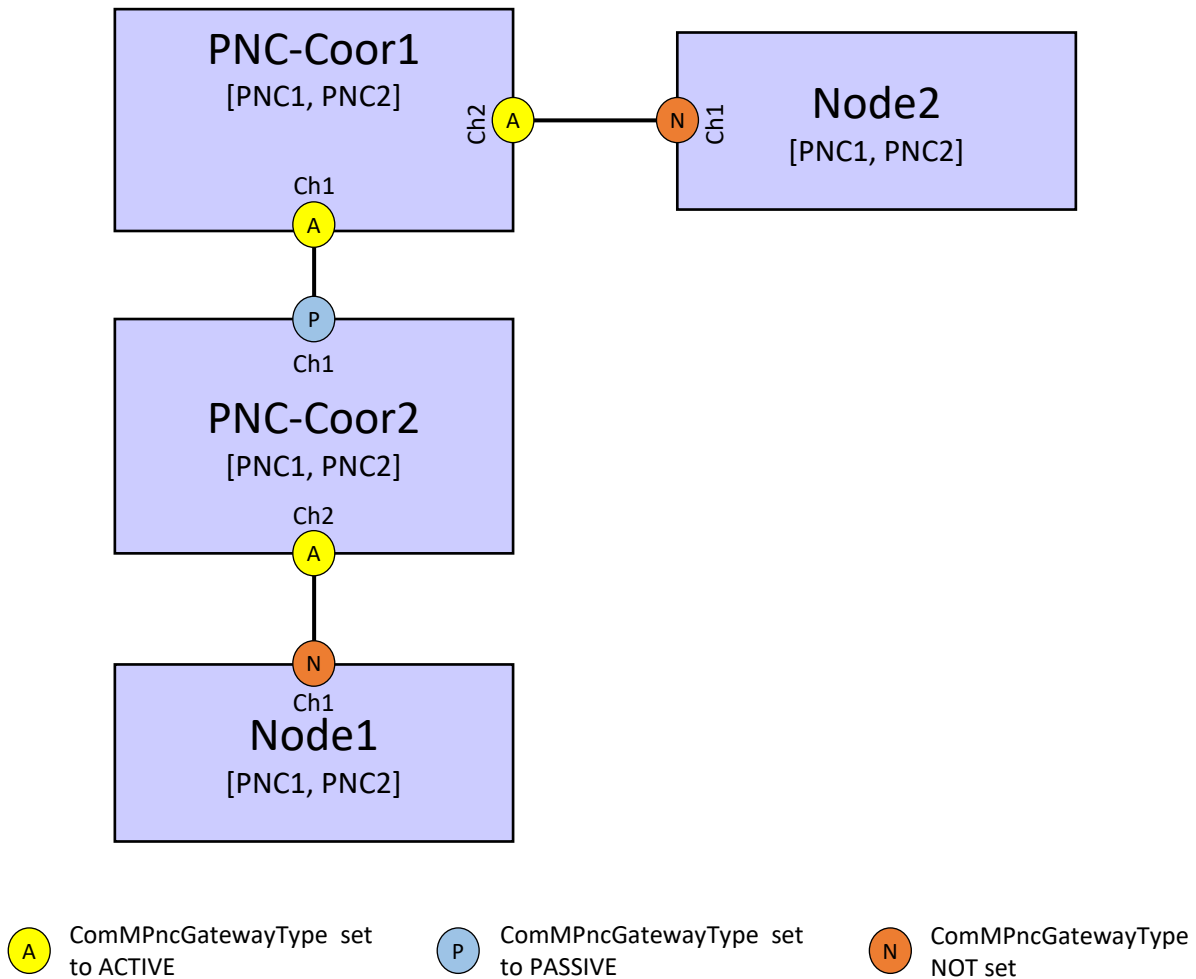

**Figure 7.4: Example for a partial network (PN) topology that reflect the hierarchy**

Figure 5 shows PNC-Coor1 as top-level PNC coordinator, PNC-Coor2 as intermediate PNC coordinator, Node1 and Node2 as PNC leaf node which resides on the lowest level of the PN topology. For example, if Node1 requests PNC1, then the PNC request is propagated across the PN to the top-level PNC coordinator. The top-level PNC coordinator "takes over" the PNC request and ensures that the PNC request is distributed across the PN. Therefore the top-level PNC coordinator mirrors back the PNC request on channel 1 (PNC-Coor1.Ch1) and forward the PNC request to channel 2 (PNC-Coor2.Ch2). If for example Node1 releases PNC1 and no other ECU in the network has PNC1 requested, then Node1 will still receive Nm frames from the top-level PNC coordinator where the PNC1 is requested. The release of the PNC leaf node is not forwarded immediately across the PN topology from the PNC leaf node to the top-level PNC coordinator. The release of a PNC is delayed by the PN reset time on each PN topology level. If the top-level PNC coordinator detects that a PN reset timer for a particular PNC expires, then no other ECU in the PN request this PNC. The top-level PNC coordinator resets the PN reset timer of the released PNC once more and transmits a so-called PN shutdown message to ensure a nearly synchronized shutdown of the PNC, across all PN levels from the top-level PNC coordinator down to the PNC leaf nodes. An intermediate PNC coordinator reacts immediately upon reception

on a PN shutdown message. Therefore the intermediate PNC coordinator releases the indicated PNC, resets the PN reset timer once more and forwards the PN shutdown message on all `ComMChannel`s which are actively coordinated and assigned to the affected PNC. Thus, all PNC state machines of the released PNC across all PN level from the top-level PNC coordinator down to the PNC leaf nodes reside in `COMM_PNC_-READY_SLEEP` and reset the corresponding PN reset timer nearly at the same point in time. This will lead to a synchronized PNC shutdown to avoid timeouts on application level.

Please refer also to the sequence diagrams Figure 9.5, Figure 9.6 and Figure 9.7 which depict the handling of a synchronized PNC shutdown in the role of a top-level PNC coordinator and an intermediate PNC coordinator.

Note:

- For `ComMChannel`s which are configured for a uni-directional PNC handling (see 7.1.6.2), no synchronized PNC shutdown is performed.

- For PNCs which reference a `ComMChannel` via the parameter `ComMChannelPerTxOnlyPnc` (see 7.1.6.3), no synchronized PNC shutdown is performed.

### 7.1.4.5 Support for multiple top-level PNC coordinators

According to chapter 7.1.4.4 a PN topology always have at least one top-level PNC coordinator. The top-level PNC coordinator for a particular PNC is designated if all `ComMChannel`s have `ComMPncGatewayType` set to `COMM_GATEWAY_TYPE_ACTIVE` where this particular PNC is assigned to (see [SWS_ComM_01083]). For different PNCs it is possible to have different top-level PNC coordinators. For the same PNC usually one top-level PNC coordinator is used (see Figure 7.5). But it is also possible to have multiple top-level PNC coordinators for the same PNC, if the PN topology fulfill the design constraint of SystemTemplate constr_pnc90. Figure 7.6 shows an example of valid PN with multiple top-level PNC coordinators of the same PNC.
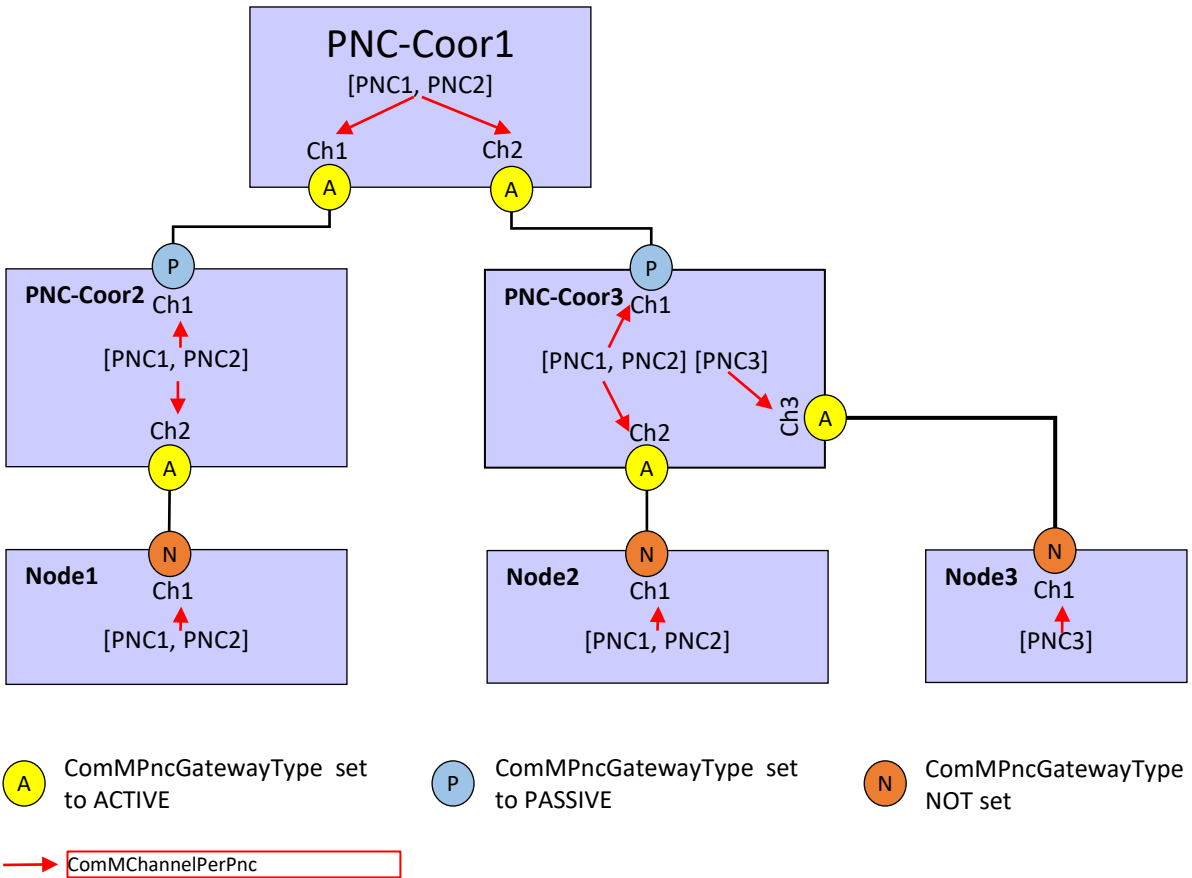

**Figure 7.5: One top-level PNC coordinator per PNC**

In Figure 7.5 PNC-Coor1 act as top-level PNC coordinator for PNC1 and PNC2. PNC-Coor3 act as top-level PNC coordinator for PNC3. Thus, if synchronized PNC shutdown is enabled, then PNC-Coor1 is responsible to initiate a synchronized PNC shutdown for PNC1 and PNC2. PNC-Coor3 is responsible to initiate a synchronized PNC shutdown for PNC3.
**Figure 7.6: Multiple top-level PNC coordinators of the same PNC**

In Figure 7.6 PNC-Coor2 and PNC-Coor3 act as top-level PNC coordinator for PNC3. For a proper behaviour, the NM filter mask at PNC-Coor3.Ch1 need to be configured such that PNC3 bit pass the filter. If synchronized PNC shutdown is enabled, then the expected behaviour should be as described in the following point:

- if PNC-Coor2 request the PNC3, then this PNC request is forwarded by PNC-Coor3 to Node3

- if only PNC-Coor2 has requested PNC3 and PNC-Coor2 release PNC3, then PNC-Coor2 transmit a PN shutdown message. PNC-Coor3 forward the synchronized PNC shutdown to PNC-Coor3.Ch3 (see [SWS_ComM_01082]). Therefore PNC3 synchronously shutdown on all affected nodes from PNC-Coor2, across PNC-Coor3 down to Node3. Thus, PNC-Coor2 act as the top-level coordinator for PNC3 in that scenario.

- If only Node3 request PNC3, then PNC-Coor3 consider only PNC-Coor3.Ch3 to mirror back the PNC request. The PNC request is not forwarded to any other channel for this PNC request, since PNC3 reference only PNC-Coor3.Ch3.

- If only Node3 has requested PNC3 and Node3 release PNC, then PNC-Coor3 transmit a PN shutdown message on PNC-Coor3.Ch3. Thus, PNC-Coor3 act as the top-level coordinator for PNC3 in that scenario.

- If Node3 and PNC-Coor2 has requested PNC3 and Node3 release PNC3, then the PNC3 request of PNC-Coor2 keep PNC3 requested.

- If Node3 and PNC-Coor2 has requested PNC3 and PNC-Coor2 release PNC3, then PNC-Coor2 transmit a PN shutdown message on PNC-Coor2.Ch3. PNC-Coor3 will not forward the PN shutdown request on PNC-Coor3-Ch3, since ERA of PNC-Coor3.Ch3 still contain PNC3 request from Node3 (see [SWS_ComM_01082]). Thus, PNC-Coor2 will asynchronously shutdown PNC3, since PNC-Coor3 will consider the PNC request from Node3 as long as Node3 request PNC3. After Node3 has released PNC3, PNC-Coor3 and Node3 shutdown PNC3 synchronously, sinc PNC-Coor3 act as top-level PNC coordinator

Note: The network topology and communication design has to ensure a valid and supported PN topology

### 7.1.5 Dynamic PNC-to-channel-mapping (optional)

This feature adds the possibility to update the PNC-to-channel-mapping of the PNC Gateway during runtime. This update works via a request-response-based learning process of all participating Nodes. When Partial Network learning is requested within the Nm PDUs, all participating Nodes will respond their current PNC membership on the corresponding channel and the PNC Gateway then updates the current PNC-to-channel-mapping accordingly.

**[SWS_ComM_CONSTR_00004]** ⌈If at least one channel is referenced by a PNC by using `ComMChannelPerTxOnlyPnc`, then `ComMDynamicPncToChannelMapping-Support` shall be set to FALSE. Otherwise the configuration is invalid. A configuration tool shall reject such a configuration as invalid (error).⌋

**[SWS_ComM_01026]**

   *Upstream requirements:* SRS_ModeMgm_09260

⌈If the function ComM_Nm_PncLearningBitIndication has been called on a channel where ComMDynamicPncToChannelMappingEnabled is set to TRUE or when ComM calls Nm_PnLearningRequest on a channel ComM shall set the PNC Learning Phase to active for the according channel.⌋

**[SWS_ComM_01029]**

*Upstream requirements:* SRS_ModeMgm_09265

⌈If `ComMDynamicPncToChannelMappingEnabled` is set to TRUE and function ComM_Nm_RepeatMessageLeftIndication has been called ComM shall set the PNC Learning Phase to inactive for the according channel.⌋

**[SWS_ComM_01028]**

*Upstream requirements:* SRS_ModeMgm_09261

⌈If `ComMPncGatewayEnabled` is set to TRUE and the function ComM_Nm_PncLearningBitIndication has been called for a channel either of the following actions shall be performed:

- when ComM_Nm_PncLearningBitIndication is called for a channel where `ComMPncGatewayType` is set to `COMM_GATEWAY_TYPE_ACTIVE`, ComM shall forward the Learning Request by calling Nm_PnLearningRequest on all further coordinated ComM channels (active or passive) with `ComMDynamicPncToChannelMappingEnabled` is set to TRUE

- when ComM_Nm_PncLearningBitIndication is called for a channel where `ComMPncGatewayType` is set to `COMM_GATEWAY_TYPE_PASSIVE`, ComM shall forward the Learning Request by calling Nm_PnLearningRequest on ComM channels with `ComMPncGatewayType` set to `COMM_GATEWAY_TYPE_ACTIVE` and `ComMDynamicPncToChannelMappingEnabled` is set to TRUE

⌋

Rational: Partial network learning bit needs to be forwarded to all nodes in the network but it needs not to be mirrored back even in the case when network topology contains circles.

**[SWS_ComM_01090]**

*Upstream requirements:* SRS_ModeMgm_09261

⌈If `ComMPncGatewayEnabled` and ComMPncDynamicMappingSupport are set to TRUE and when the PNC Learning Phase is active, then ComM shall forward received ERA Rx information on channels where `ComMDynamicPncToChannelMappingEnabled` is set to TRUE. ComM shall set the affected PNC bit(s) in all affected ERAn on all other channels where `ComMDynamicPncToChannelMappingEnabled` is set to TRUE considering the following rules:

- Rx ERA received on channels with `ComMPncGatewayType` set to `COMM_GATEWAY_TYPE_ACTIVE` shall be forwarded on all other coordinated channels (active or passive)

- Rx ERA received on channel with `ComMPncGatewayType` set to `COMM_GATEWAY_TYPE_PASSIVE` shall be forwarded on all other channels where `ComMPncGatewayType` set to `COMM_GATEWAY_TYPE_ACTIVE`

⌡

### 7.1.5.1 Update PNC-to-channel-mapping

The PNC Gateway needs to be capable to update its PNC-to-channel Mapping on runtime.

**[SWS_ComM_01091]**

*Status:*                    DRAFT

*Upstream requirements:* SRS_ModeMgm_09258

⌈If `ComMPncGatewayEnabled` is set to TRUE and when the PNC Learning Phase is active and an PNC bit in the ERA is set to "1" on a channel where `ComMDynamicPncToChannelMappingEnabled` is set to TRUE ComM shall set PNC-to-channel Mapping to 1 for every ComMPnc on the according channel where this PNC bit in the ERA has been set to "1" for the according PNC.⌋

### 7.1.5.2 PNC Membership Forwarding

Every participating Node has to transmit its current PNC membership during PNC Learning phase. The PNC Gateway needs additionally also forward PNC memberships received from other channels.

**[SWS_ComM_01092]**

*Upstream requirements:* SRS_ModeMgm_09262, SRS_ModeMgm_09250

⌈If `ComMPncGatewayEnabled` is set to FALSE and when the PNC Learning Phase is active, the ComM shall set the corresponding PNC bits in the IRA with the value of the current PNC membership and call Nm_UpdateIRA(<channel>, <IRA>) for all ComM channels where `ComMDynamicPncToChannelMappingEnabled` is set to TRUE.⌋

**[SWS_ComM_01093]**

*Upstream requirements:* SRS_ModeMgm_09261, SRS_ModeMgm_09250

⌈If `ComMPncGatewayEnabled` is set to TRUE and when the PNC Learning Phase is active, the ComM shall call Nm_UpdateIRA(<channel>, <IRA>) for all ComM channels where `ComMDynamicPncToChannelMappingEnabled` is set to TRUE with the IRA set with the value of the current PNC membership merged with the PNC information that needs to be forwarded according to [SWS_ComM_01090].⌋

### 7.1.6 Partial Networking Configuration Hints

The partial network configuration has to consider the configuration of the corresponding PN filter mask in NM of the corresponding NM-channels. If using a SystemDescriptionExtract to configure the BSW stack and the modelled partial network is available within the SystemDescriptionExtract, then the PN filter mask is derived automatically per each NM-channel. It is up to the integration process and the integration restriction to change the PN filter mask manually after the derivation. The integration process and particular restrictions is not dedined by AUTOSAR to support flexibility.

The following chapters describe the supported use cases to be considered for a proper PNC handling of PNC gateways and none PNC gateways

#### 7.1.6.1 Bi-directional PNC handling

This means, that PNC requests are always transferred in both directions. The handling of PNC request is symmetrically for transmission and reception:

- PNC gateways forward incoming (external) PNC request and mirror them back

- None PNC gateways react on incoming PNC request and transmit PNC requests according to PNC assignment

Thus, ComM transmit and handle received PNC requests for a PNC on those `ComMChannel`s, where a particular PNC refer to the `ComMChannel` by using the parameter `ComMChannelPerPnc` (see [ECUC_ComM_00880]). The correctness of received PNCs within the PNC bit vector according to the `ComMChannel` assignment has to be ensured by a proper configuration of the PN filter mask per NM-channel in the NmIf.

Note: ComM doesn't check the correctness of the received PNC according to the `ComMChannel` assignment:

- For EIRA updates, ComM has no possibility to check on which `ComMChannel` the PNC request was received, since the `ComMChannel` information is not forwarded by the NmIf.

- For ERA updates, a check could be done, but it was decided in AUTOSAR to release ComM from this responsibility.

In both cases (PNC gateway use case and none PNC gateway) the PN filter mask of a NM-channel have to pass all PNCs which are reference the corresponding `ComMChannel`s via `ComMChannelPerPnc`

#### 7.1.6.2 Uni-directional PNC handling

This means, that PNC requests are transferred in one direction. The handling of PNC request is asymmetrically for transmission and reception:

- PNC gateways forward incoming (external) PNC request but do not mirror it back on the `ComMChannel` the PNC request was received

- None PNC gateways transmit PNC requests for PNCs on `ComMChannel`s, where this PNC is not assigned to

For PNC gateways the PN filter mask of a NM-channel has to pass all PNCs which are acceptable to be received on a `ComMChannel` and the PNCs do NOT refer the ComM-Channes via `ComMChannelPerPnc` (no PNC-channel relation exist). Addtionally, the PNC ERA handling has to be enabled for the according NM-channel. For received PNC requests on `ComMChannel` where no PNC-channel relation exit, only the forwarding of PNC requests and no mirroring back on the receiving `ComMChannel` will be performed. For received PNC requests on a `ComMChannel` where a PNC-channel relation exit, the bi-directional PNC handling will be performed.

The uni-directional PNC handling for PNC gateways could be used, e.g. when a network needs information from a certain PNC but there is no need to provide any information back.

For none PNC gateways the PN filter mask of a NM-channel has to reject all PNCs which are considered to be only transmitted on a `ComMChannel`. Received PNC request of those `ComMChannel` should not be handled and therefore should not reach ComM.

The uni-directional PNC handling for none PNC gateways could be used, e.g. when an ECU needs to wake-up or keep-alive some functionality without being part of it.

### 7.1.6.3  Transmission only PNC handling

This means, that internal PNC requests due to PNC coordination (i.e. triggered externally by a received PNC request (PNC bit set in the ERA)) are transferred for transmission. Thereby only the internal request array (IRA) is updated without requesting the according `ComMChannel`. A local `ComMUser` request which refer to this PNC, would result in `ComMChannel` request. This could be achieved via a proper configuration, such that a PNC refer to a `ComMChannel` via `ComMChannelPerTxOnlyPnc`.

Expected runtime behaviour:

- If a PNC refers to a `ComMChannel` (e.g. ComMChannel_A) by using the reference `ComMChannelPerTxOnlyPnc` (see [ECUC_ComM_00900]), this PNC refers to at least one further `ComMChannel` (e.g. ComMChannel_B) by using `ComMChannelPerPnc` (see [ECUC_ComM_00880]) and this PNC is requested externally by a received PNC request (PNC bit set in the ERA), then the corresponding PNC state machine transit to `COMM_PNC_REQUESTED` the IRA of all referenced `ComMChannel`s are updated and the channel state machine of ComM-Channel_B is requested, while the channel state machine of ComMChannel_A is NOT requested.

- If a PNC refers exclusively to `ComMChannel`s by using the reference `ComMChannelPerTxOnlyPnc` (see [ECUC_ComM_00900]), this PNC is requested externally by a received PNC request (PNC bit set in the ERA) and no local user requests this PNC, then the corresponding PNC state machine and the according `ComMChannel`s are not affected:

  - PNC statemachine stays in `COMM_PNC_NO_COMMUNICATION` and therefore IRAs for those `ComMChannel`s are NOT updated

  - the referenced `ComMChannel` state machines are NOT requested

- If a PNC refer to a `ComMChannel` by using the reference `ComMChannelPerTxOnlyPnc` (see [ECUC_ComM_00900]) and this PNC is requested locally by `ComMUser`, then the corresponding PNC state machine transit to `COMM_PNC_REQUESTED`, IRA for this `ComMChannel` is updated and the referenced `ComMChannel` state machine is requested with `COMM_FULL_COMMUNICATION`.

- If a PNC refer to a `ComMChannel` by using the reference `ComMChannelPerTxOnlyPnc` (see [ECUC_ComM_00900]), this PNC is requested locally by `ComMUser` and additional externally by a received PNC request (PNC bit set in the ERA), then the corresponding PNC state machine transit to `COMM_PNC_REQUESTED`, IRA for this `ComMChannel` is updated and the referenced `ComMChannel` state machine is requested with `COMM_FULL_COMMUNICATION`. If the local `ComMUser` release the request for this PNC, then the `ComMChannel` will be released, but the IRA of this `ComMChannel` will still have the corresponding PNC bit set to '1' as long as the PNC is externally requested.

- If a PNC refer to a `ComMChannel` by using the reference `ComMChannelPerTxOnlyPnc` (see [ECUC_ComM_00900]), the `ComMChannel` is not referenced by another PNC via `ComMChannelPerPnc` and a wake up is detected, then the PNC statemachine will stay in `COMM_PNC_NO_COMMUNICATION`. (Please refer to [SWS_ComM_01063], [SWS_ComM_01064], [SWS_ComM_01065], [SWS_ComM_01066])

The transmission-only-PNC handling could be used e.g. for none PNC gateways to request only PNCs without additionally requesting the NM.

The transmission only PNC handling could be used e.g. for PNC gateways to receive uni-directional PNC request (PNC1) on one channel (channel A) and forward the PNC request without requesting the NM on another channel (channel B). On channel B PNC1 is configured for bi-directional PNC handling, therefore a received PNC request for PNC1 is forwarded to channel A by considering to request the affected `ComMChannel`s and the according NM.

Note: The reference `ComMChannelPerTxOnlyPnc` cannot be derived from a SystemDescriptionExtract. The reference from a PNC to a ComM channel via `ComMChannelPerTxOnlyPnc` could only be added manually within the integration phase.

## 7.2   ComM channel state machine

**[SWS_ComM_00979]**

*Upstream requirements:* SRS_ModeMgm_09243

⌈If the optional PNC functionality is enabled (see [ECUC_ComM_00839]), all PNC actions shall be performed before the channel related actions are executed.⌋

**[SWS_ComM_00980]**

*Upstream requirements:* SRS_ModeMgm_09243

⌈If the parameter `ComMPncNmRequest` is set to TRUE (see [ECUC_ComM_00886]), if the "FULL Communication" is requested due to a change in the PNC state machine to `COMM_PNC_REQUESTED` (see [SWS_ComM_01068]) API Nm_NetworkRequest() shall be called, even if the current state is already "Full communication".⌋

Rationale: It is the trigger to enable the NM to transmit the NM message immediately n-times (n=configurable) to ensure a wake up and a synchronization of the PNC transceiver.

**[SWS_ComM_00051]**

*Upstream requirements:* SRS_ModeMgm_09080

⌈ComM shall implement one channel state machine for every communication channel independently.⌋

Note to [SWS_ComM_00051]: The channel state maching is shown in Figure 7.7 and an overview of the requirements for the channel state machine transtions is listed in Table 7.1

Rationale for [SWS_ComM_00051]: Needed communication capability of channels may be different, thus the controlling must be independent.

Use Case for [SWS_ComM_00051]: On an ECU with CAN and LIN channel, only the LIN requires full communication to request e.g. sensor values while the CAN remains inactive.
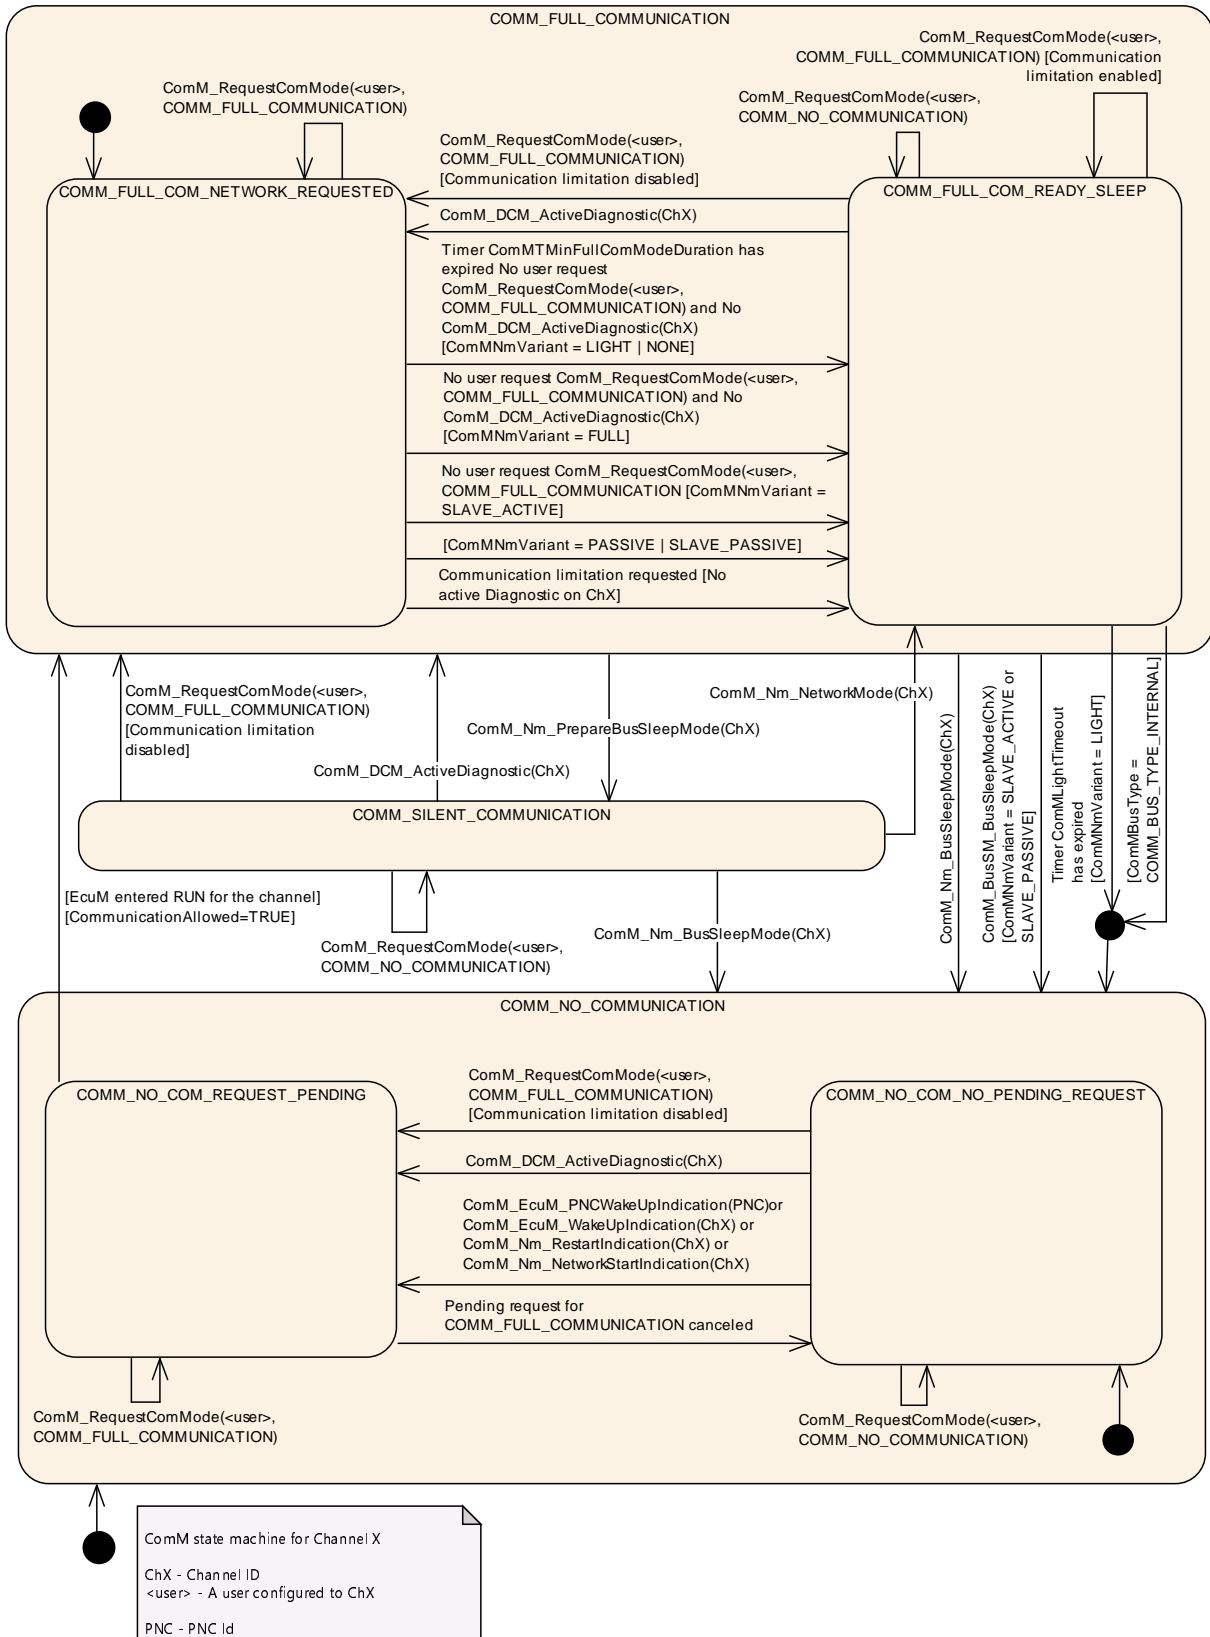

**Figure 7.7: ComM channel state machine**

| COMM_SILENT_COMMUNICATION<br>COMM_NO_COMMUNICATION | [SWS_ComM_00295] |

**Table 7.1: Link to detailed explanation of the channel state machine resp. transition**

**[SWS_ComM_00879]**

*Upstream requirements:* SRS_ModeMgm_09083

⌈The ComM channel state machine shall consist of the three main states corresponding to the Communication Modes: `COMM_NO_COMMUNICATION`, `COMM_SILENT_COMMUNICATION` and `COMM_FULL_COMMUNICATION`.⌋

**[SWS_ComM_00880]**

*Upstream requirements:* SRS_ModeMgm_09083

⌈The `COMM_FULL_COMMUNICATION` state shall have two sub-states `COMM_FULL_COM_NETWORK_REQUESTED` and `COMM_FULL_COM_READY_SLEEP`.⌋

**[SWS_ComM_00881]**

*Upstream requirements:* SRS_ModeMgm_09083

⌈The `COMM_NO_COMMUNICATION` state shall have two sub-states `COMM_NO_COM_REQUEST_PENDING` and `COMM_NO_COM_NO_PENDING_REQUEST`⌋

Rationale for [SWS_ComM_00879] and [SWS_ComM_00880]: `COMM_FULL_COM_READY_SLEEP` and `COMM_SILENT_COMMUNICATION` are necessary to synchronize a communication shutdown on the bus. If only one ECU switches the communication off, the others store errors because this ECU stops sending application signals.

Comment: The main states present an abstracted status of communication capabilities per channel, which are in focus of the users' interests. The sub-states represent intermediate states, which perform activities to support a synchronized transition with external partners and managing protocols (e.g. NM)

**[SWS_ComM_00485]**

*Upstream requirements:* SRS_ModeMgm_09083

⌈The default state for each ComM channel state machine shall be `COMM_NO_COMMUNICATION`.⌋

**[SWS_ComM_00896]** ⌈Each ComM channel state machine shall only evaluate its corresponding communication status flag CommunicationAllowed according to [SWS_ComM_00884] in sub-state `COMM_NO_COM_REQUEST_PENDING`.⌋

Rationale for [SWS_ComM_00896]: A `ComM_CommunicationAllowed(<channel>,FALSE)` ([SWS_ComM_00871]) indication has no visible effect if the channel is not in sub-state `COMM_NO_COM_REQUEST_PENDING`, i.e. ComM channel state machine will not immediately change to state `COMM_NO_COMMUNICATION` if in another state as e.g. `COMM_FULL_COMMUNICATION`

Note for [SWS_ComM_00896]: It is assumed, that CommunicationAllowed is set to TRUE via `ComM_CommunicationAllowed()` after a ECU was woken up and all potential validation checks are finalized to ensure a proper communication via the corresponding channel. Therefore no transition from `COMM_NO_COM_REQUEST_PENDING` to `COMM_NO_COM_NO_PENDING_REQUEST` is available, since CommunicationAllowed is already set to TRUE or will be set to TRUE via `ComM_CommunicationAllowed()` within the wake-up processing of an ECU.

**[SWS_ComM_00472]**

 *Upstream requirements:* SRS_ModeMgm_09085

⌈Main state changes (see [SWS_ComM_00879]) shall be indicated to the users with the corresponding notifications. Exception: Default state after initialization, see [SWS_ComM_00313].⌋

Comment on [SWS_ComM_00472]: If more than one user is related to the corresponding channel state machine, the ComM module has to perform a Fan-out to all users.

Note for [SWS_ComM_00472]: For more details regarding the notification refer to Section 8.6.1.5 and Section 8.6.1.6.

**[SWS_ComM_00191]**

 *Upstream requirements:* SRS_ModeMgm_09172, SRS_ModeMgm_09149

⌈The internal functionality of the ComM channel state machine(s) shall be invisible for the users. The user neither needs nor shall get any information about the internal mechanisms and rules (e.g. "highest wins" strategy) of the ComM channel state machine.⌋

An overview of the requested communication capabilities in the Corresponding Mode is shown in Table 7.2.

| Communication Mode | Message Transmission | Message Reception | NM<br><br>(`ComMNmVariant`=`FULL`) | Wake-up/Restart<br><br>capability |
|---|---|---|---|---|
| `COMM_FULL_-COMMUNICATION` | On | On | Bus communication requested | N/A |
| `COMM_FULL_-COMMUNICATION_-WITH_WAKEUP_-REQUEST` | On | On | Bus communication requested | Request the lower layer to trigger a wake-up on the network |
| `COMM_SILENT_-COMMUNICATION` | Off | On | Bus communication released | • User/diagnostic request<br>• Network indication |

<div align="center">▽</div>

△

| Communication Mode | Message Transmission | Message Reception | NM (`ComMNmVariant=FULL`) | Wake-up/Restart capability |
|---|---|---|---|---|
| `COMM_NO_-COMMUNICATION` | Off | Off | Bus communication released | • User/diagnostic request<br>• Passive wake-up |

**Table 7.2: Granted communication capabilities in the corresponding modes**

**[SWS_ComM_01056]**

*Upstream requirements:* SRS_ModeMgm_09268

⌈Requests for communication mode `COMM_FULL_COMMUNICATION_WITH_-WAKEUP_REQUEST` shall be handled as request for `COMM_FULL_COMMUNICATION` within the ComM channel state machine. Deviations of ComM channel machine state transitions and behavior within the states are specified explicitly.⌋

Notes for section 7.1.1 - 7.1.3:

- Each ComM channel state machine is responsible to handle one channel/network with a connected Bus State Manager ("corresponding" = the channel/network the ComM channel state machine is responsible for).

- The ComM module contains one or several ComM channel state machine(s). ComM channel state machine communicates directly with its connected Bus State Manager, other interfaces are handled by the ComM module.

### 7.2.1 ComM managed and managing channels

A ComM channel could reference other ComM channels. The reference is configurable by setting `ComMManageReference` (see [ECUC_ComM_00893]). The source ComM channel of a `ComMManageReference` is called "managing channel" and the target ComM channel is called "managed channel". A managing channel could reference 0..n managed channels. A managed channel could be referenced by exclusively 1 managing channel.

This is used to support use cases, were a managing channel handle the interaction with the NM module and the managed channel has no NM.

Note: The following limitation have to be considered for a managing channel:

- ComMNmVariant of a managing channel is set to `FULL` (see [ECUC_ComM_00568])

Note: The following limitations have to be considered for a managed channel:

- ComMNmVariant of a managed channel is set to `LIGHT`, since the managing channel is responsible for the interaction with the NmChannel (see [ECUC_ComM_00568])

- `ComMPncGatewayType` of a managed channel is neither set to `COMM_-GATEWAY_TYPE_ACTIVE` nor `COMM_GATEWAY_TYPE_PASSIVE` (see [ECUC_ComM_00842])

### 7.2.2 Behavior in state `COMM_NO_COMMUNICATION`

**[SWS_ComM_00898]**

*Upstream requirements:* SRS_ModeMgm_09247

⌈On entering state `COMM_NO_COMMUNICATION` the ComM channel state machine shall go to sub-state `COMM_NO_COM_NO_PENDING_REQUEST`.⌋

**[SWS_ComM_00313]**

*Upstream requirements:* SRS_ModeMgm_09085

⌈On entering state `COMM_NO_COMMUNICATION` by default after initialization, ComM module shall not indicate the mode change to users via RTE or BswM.⌋

Rationale for [SWS_ComM_00313]: The RTE is not yet initialized at this point in time.

**[SWS_ComM_00073]**

*Upstream requirements:* SRS_ModeMgm_09083

⌈On entering state `COMM_NO_COMMUNICATION` the ComM channel state machine shall switch off the transmission and reception capability. This shall be performed by the ComM channel state machine requesting the corresponding Communication Mode from the Bus State Manager module (<Bus>SM_RequestComMode(network:=<channel state machine's network>, mode:= `COMM_NO_COMMUNICATION`), see [SWS_ComM_00829]).⌋

Rationale for [SWS_ComM_00073]: The `COMM_NO_COMMUNICATION` mode forbids sending and receiving of bus communication PDUs for the corresponding channels.

**[SWS_ComM_00288]**

*Upstream requirements:* SRS_ModeMgm_09132

⌈On entering state `COMM_NO_COMMUNICATION` and configuration parameter ComMNmVariant=`FULL` (see [ECUC_ComM_00568]) the ComM module shall request release of the network from the Network Management module, Nm_NetworkRelease().⌋

Note: Nm_NetworkRelease is needed if ComM has requested the NM (Nm_NetworkRequest or Nm_PassiveStartup) for that channel before and has not yet released it.

Rationale for [SWS_ComM_00073], [SWS_ComM_00288] , [SWS_ComM_00875] and [SWS_ComM_00876]: FlexRay shutdown cannot be interrupted to avoid partial networks.

Comment: In state COMM_NO_COMMUNICATION ComM channel state machine may not request bus communication for the configured channel from the Bus State Manager module.

Use Case for above Comment: The ECU is performing control functions locally without participation in bus communication.

Comment: The communication mode is local for one channel, thus the ECU may still communicate via other channels.

#### 7.2.2.1 COMM_NO_COM_NO_PENDING_REQUEST sub-state

**[SWS_ComM_00875]**

*Upstream requirements:* SRS_ModeMgm_09083

⌈In sub-state COMM_NO_COM_NO_PENDING_REQUEST and user requests COMM_-FULL_COMMUNICATION and communication limitation is disabled, the ComM channel state machine shall immediately switch to sub-state COMM_NO_COM_REQUEST_PENDING.⌋

Note to [SWS_ComM_00875]: For more details on communication limitation refer to Section 7.4.1

**[SWS_ComM_00876]**

*Upstream requirements:* SRS_ModeMgm_09083, SRS_ModeMgm_09085

⌈In sub-state COMM_NO_COM_NO_PENDING_REQUEST ,configuration parameter ComMNmVariant=FULL|LIGHT|NONE (see [ECUC_ComM_00568]) and DCM indicate ComM_DCM_ActiveDiagnostic (see [SWS_ComM_00873]), the ComM channel state machine shall immediately switch to sub-state COMM_NO_COM_REQUEST_PENDING.⌋

Rationale for [SWS_ComM_00876]: A potential communication limitation (see Section 7.4.1) shall temporarily be inactive during an active diagnostic session (see [SWS_ComM_00182])

Note for [SWS_ComM_00876]: For diagnostic activation it is assumed that diagnostic tester keeps the bus awake, therefore no special handling needed for managed channels.

**[SWS_ComM_00893]**

*Upstream requirements:* SRS_ModeMgm_09087

⌈If ComM_EcuM_WakeUpIndication is called in sub-state `COMM_NO_COM_NO_PEND‐` `ING_REQUEST` and configuration parameter `ComMSynchronousWakeUp` is set to FALSE (see [ECUC_ComM_00695]), the ComM module shall switch the requested ComM channel state machine (resp. channels) to sub-state `COMM_NO_COM_RE‐` `QUEST_PENDING`. If the indicated ComM channel is a managed channel, then the ComM channel state machine of the referencing managing channel (see [ECUC_ComM_00893]) shall also be switched to sub-state `COMM_NO_COM_RE‐` `QUEST_PENDING`.⌋

**[SWS_ComM_00894]**

*Upstream requirements:* SRS_ModeMgm_09087

⌈In sub-state `COMM_NO_COM_NO_PENDING_REQUEST` and the NM module indicates a restart, ComM_Nm_RestartIndication() [SWS_ComM_00792], the ComM channel state machine shall immediately switch to sub-state `COMM_NO_COM_REQUEST_PEND‐` `ING`.⌋

Rationale for [SWS_ComM_00893] and [SWS_ComM_00894]: It must be guaranteed that communication starts as soon as possible after a bus wake up.

Comment: The ComM channel state machine switches immediately to sub-state `COMM_FULL_COM_NETWORK_REQUESTED` after entering the `COMM_FULL_COMMUNI‐` `CATION` state. If no user requests `COMM_FULL_COMMUNICATION` mode, the AU-TOSAR NM resp. the ComM module timer for `ComMTMinFullComModeDura‐` `tion`([ECUC_ComM_00557]) prevent toggling between `COMM_NO_COMMUNICATION` and `COMM_FULL_COMMUNICATION` to overcome the init-/start-up time of the system, before possible user requests occur.

**[SWS_ComM_00694]**

*Upstream requirements:* SRS_ModeMgm_09248

⌈If ComM_EcuM_WakeUpIndication is called in sub-state `COMM_NO_COM_NO_PEND‐` `ING_REQUEST` and configuration parameter `ComMSynchronousWakeUp` is set to TRUE (see [ECUC_ComM_00695]), the ComM module shall switch all ComM channel state machines (resp. channels) to sub-state `COMM_NO_COM_REQUEST_PENDING`.⌋

**[SWS_ComM_01014]**

*Upstream requirements:* SRS_ModeMgm_09248

⌈If ComM_EcuM_PNCWakeUpIndication(<PNC>) (see [SWS_ComM_91001]) is called in sub-state `COMM_NO_COM_NO_PENDING_REQUEST`, the configuration param-eters `ComMSynchronousWakeUp` is set to FALSE (see [ECUC_ComM_00695]) and `ComMPncSupport` is set to TRUE (see [ECUC_ComM_00839]), the ComM module

shall switch those ComM channel state machines (resp. channels) which are referenced via `ComMChannelPerPnc` (see [ECUC_ComM_00880]) by the given PNC to sub-state `COMM_NO_COM_REQUEST_PENDING`.⌋

Note for [SWS_ComM_01014]:

- This includes ComM channel state machines of managing channels, which are referenced by the indicated managed channels, as `ComMPnc`s reference always both types (see [12] [constr_3484])

- A channel which is referenced via `ComMChannelPerTxOnlyPnc`, `ComMSynchronousWakeUp` is set to FALSE and a PNC related wake-up is configured (call of EcuM_ComM_PNCWakeupIndication()), need always a `EcuMWakeupSource` which refer to this channel to ensure a proper `ComMChannel` handling. A wake up on this channel would bring the channel to a defined state, but the PNC will stay in `COMM_PNC_NO_COMMUNICATION`, since this PNC reference the channel via `ComMChannelPerTxOnlyPnc`

### [SWS_ComM_01015]

*Upstream requirements:* SRS_ModeMgm_09248

⌈If ComM_EcuM_PNCWakeUpIndication(<PNC>) (see [SWS_ComM_91001]) is called in sub-state `COMM_NO_COM_NO_PENDING_REQUEST` and configuration parameters `ComMSynchronousWakeUp` is set to TRUE (see [ECUC_ComM_00695]) and ComMPncSupportis set to TRUE (see [ECUC_ComM_00839]), the ComM module shall switch all ComM channel state machines (resp. channels) to sub-state `COMM_NO_COM_REQUEST_PENDING`.⌋

#### 7.2.2.2 `COMM_NO_COM_REQUEST_PENDING` sub-state

**[SWS_ComM_00895]** ⌈In sub-state `COMM_NO_COM_REQUEST_PENDING` the ComM channel state machine shall evaluate its corresponding CommunicationAllowed flag, stored and set according to [SWS_ComM_00884] and [SWS_ComM_00885]. If evaluated to CommunicationAllowed is set to TRUE, the ComM channel state machine shall immediately switch to state `COMM_FULL_COMMUNICATION`.⌋

### [SWS_ComM_00897]

*Upstream requirements:* SRS_ModeMgm_09083

⌈In sub-state `COMM_NO_COM_REQUEST_PENDING` and no longer any valid pending request for `COMM_FULL_COMMUNICATION`, the ComM channel state machine shall switch back to default sub-state `COMM_NO_COM_NO_PENDING_REQUEST`.⌋

Rationale for [SWS_ComM_00897]: This enable the possibility to switch back to default sub-state if communication for some reason was never allowed. E.g. transition to `COMM_NO_COM_REQUEST_PENDING` triggered by user request for ComM_RequestComMode(<user>,`COMM_-FULL_COMMUNICATION`)(see [SWS_ComM_00871]) or DCM indicated ComM_DCM_ActiveDiagnostic(<channel>) (see [SWS_ComM_00873]), but now canceled with ComM_RequestComMode(<user>,`COMM_NO_COMMUNICATION`) (see [SWS_ComM_00871]) or DCM ComM_DCM_InactiveDiagnostic(<channel>) (see [SWS_ComM_00874]).

### 7.2.3 Behavior in state `COMM_SILENT_COMMUNICATION`

**[SWS_ComM_00071]** ⌈On entering state `COMM_SILENT_COMMUNICATION` the ComM channel state machine shall switch off the transmission capability (and keep reception capability on). This shall be performed by the ComM channel state machine requesting the corresponding Communication Mode from the Bus State Manager module (<Bus>SM_RequestComMode(network:=<channel state machine's network>, mode:= `COMM_SILENT_COMMUNICATION`), see [SWS_ComM_00829]).⌋

Rationale for [SWS_ComM_00071]: The `COMM_SILENT_COMMUNICATION` mode permits receiving of bus communication PDUs and forbids sending of bus communication PDUs.

Comment: It may happen that nothing is received (e.g. during bus off) despite receiving capability is switched on.

Use Case: Shut down coordination with means of the NM module (prepare bus sleep state).

**[SWS_ComM_00877]**

  *Upstream requirements:* SRS_ModeMgm_09246

⌈In state `COMM_SILENT_COMMUNICATION` and user requests `COMM_FULL_COMMU-NICATION` and communication limitation is disabled, the ComM channel state machine shall switch to state `COMM_FULL_COMMUNICATION`.⌋

Note to [SWS_ComM_00877]: For more details on communication limitation refer to Section 7.4.1

**[SWS_ComM_00878]** ⌈In state `COMM_SILENT_COMMUNICATION` ,configuration parameter ComMNmVariant=`FULL`|`LIGHT`|`NONE` ([ECUC_ComM_00568]) and DCM indicate ComM_DCM_ActiveDiagnostic([SWS_ComM_00873]), the ComM channel state machine shall switch to state `COMM_FULL_COMMUNICATION`.⌋

Rationale for [SWS_ComM_00878]: A potential communication limitation (see Section 7.4.1) shall temporarily be inactive during an active diagnostic session, see [SWS_ComM_00182]

**[SWS_ComM_00295]** ⌈In state `COMM_SILENT_COMMUNICATION` and the Network Manager module indicates ComM_Nm_BusSleepMode()([SWS_ComM_00392]), the ComM channel state machine shall switch to state `COMM_NO_COMMUNICATION`.⌋

**[SWS_ComM_00296]** ⌈In state `COMM_SILENT_COMMUNICATION` and the Network Manager module indicates ComM_Nm_NetworkMode() ([SWS_ComM_00390]), the ComM channel state machine shall switch to state `COMM_FULL_COMMUNICATION` and sub-state `COMM_FULL_COM_READY_SLEEP`.⌋

### 7.2.4  Behavior in state `COMM_FULL_COMMUNICATION`

#### [SWS_ComM_00899]

*Upstream requirements:* SRS_ModeMgm_09083

⌈On entering state `COMM_FULL_COMMUNICATION` the ComM channel state machine shall go to sub-state `COMM_FULL_COM_NETWORK_REQUESTED`, if not a specific sub-state is specified in the transition.⌋

Rationale for [SWS_ComM_00899]: When switching from `COMM_SILENT_COMMUNICATION`, the ComM channel state machine can switch directly to sub-state `COMM_FULL_COM_READY_SLEEP`, if specified in the transition, see [SWS_ComM_00296].

#### [SWS_ComM_00069]

*Upstream requirements:* SRS_ModeMgm_09268

⌈On entering state `COMM_FULL_COMMUNICATION` the ComM channel state machine shall switch on the transmission and reception capability. This shall be performed by the ComM channel state machine requesting the corresponding Communication Mode from the Bus State Manager module:

- If Communication Mode `COMM_FULL_COMMUNICATION` was requested , then <Bus>SM_RequestComMode(network:=<channel state machine's network>, mode:= `COMM_FULL_COMMUNICATION`) shall be called

- If Communication Mode `COMM_FULL_COMMUNICATION_WITH_WAKEUP_REQUEST` was requested and `ComMWakeupSleepRequestEnabled` of the ComM channel is set to TRUE, then <Bus>SM_RequestComMode(network:=<channel state machine's network>, mode:= `COMM_FULL_COMMUNICATION_WITH_WAKEUP_REQUEST`) shall be called

- If Communication Mode `COMM_FULL_COMMUNICATION_WITH_-WAKEUP_REQUEST` was requested and ComMWakeupSleepRequestEnabled of the ComM channel is set to FALSE or not available, then <Bus>SM_RequestComMode(network:=<channel state machine's network>, mode:= `COMM_FULL_COMMUNICATION`) shall be called

⌋

Rationale for [SWS_ComM_00069]: The `COMM_FULL_COMMUNICATION` or `COMM_-FULL_COMMUNICATION_WITH_WAKEUP_REQUEST` mode permits sending and receiving of bus communication PDUs for the corresponding channels.

**[SWS_ComM_01057]**

   *Upstream requirements:* SRS_ModeMgm_09268

⌈Every time a ComM channel is requested with `COMM_FULL_COMMUNICATION_-WITH_WAKEUP_REQUEST` and `ComMWakeupSleepRequestEnabled` of the ComM channel is set to TRUE, ComM shall request the corresponding network of the ComM channel by calling

<Bus>SM_RequestComMode(`COMM_FULL_COMMUNICATION_WITH_WAKEUP_RE-QUEST`), even if the ComM channel is already in state `COMM_FULL_COMMUNICATION`. If `ComMWakeupSleepRequestEnabled` of the ComM channel is set to FALSE or not available, the ComM shall ignore the request.⌋

Note: The re-trigger of the <Bus>SM state machine is used to trigger a wake-up on the network, if the used hardware is supporting such a functionality (e.g. Ethernet hardware compliant to OA TC10 (see [2]))

**[SWS_ComM_00637]**

   *Upstream requirements:* SRS_ModeMgm_09083

⌈In state `COMM_FULL_COMMUNICATION` and the Network Manager module indicates ComM_Nm_BusSleepMode() ([SWS_ComM_00392]), the ComM channel state machine shall switch to state `COMM_NO_COMMUNICATION`.⌋

Rationale for [SWS_ComM_00637]: A user may request to keep the bus awake "too late" (NM is not able to send a vote to keep the bus awake because the cluster already agreed to shutdown).

**[SWS_ComM_01018]**

*Upstream requirements:* SRS_ModeMgm_09266, SRS_ModeMgm_09267

⌈In state `COMM_FULL_COMMUNICATION` and configuration parameter ComMNmVariant=`SLAVE_ACTIVE` | `SLAVE_PASSIVE` and the Bus State Manager module indicates ComM_BusSm_BusSleepMode() (see [SWS_ComM_91000]), the ComM channel state machine shall switch to state `COMM_NO_COMMUNICATION`.⌋

**[SWS_ComM_00826]** ⌈In `COMM_FULL_COMMUNICATION` and configuration parameter ComMNmVariant=`FULL`|`PASSIVE` ([ECUC_ComM_00568]) and the Network Manager module indicates ComM_Nm_PrepareBusSleepMode() ([SWS_ComM_00391]), the ComM state machine shall switch to state `COMM_SILENT_COMMUNICATION`.⌋

Rationale for [SWS_ComM_00826]: ComM_Nm_PrepareBusSleepMode() cannot be received before an active request is released via Nm_NetworkRelease(), and a PASSIVE channel cannot be woken up by an active wake-up, therefore it is safe to assume that the transition is always valid.

### 7.2.4.1 `COMM_FULL_COM_NETWORK_REQUESTED` sub-state

**[SWS_ComM_00886]**

*Upstream requirements:* SRS_ModeMgm_09087

⌈On entering sub-state `COMM_FULL_COM_NETWORK_REQUESTED` and configuration parameter ComMNmVariant=`LIGHT`|`NONE` ([ECUC_ComM_00568]), the timer for `ComMTMinFullComModeDuration` ([ECUC_ComM_00557]) shall be started.⌋

**[SWS_ComM_00665]**

*Upstream requirements:* SRS_ModeMgm_09132

⌈On entering sub-state `COMM_FULL_COM_NETWORK_REQUESTED` from `COMM_NO_COM_REQUEST_PENDING` and EcuM module has indicated a wake-up by ComM_EcuM_WakeUpIndication(<channel>) (see [SWS_ComM_00275]) or by ComM_EcuM_PNCWakeUpIndication(<PNC>) (see [SWS_ComM_91001]), the ComM module shall request Nm_PassiveStartup(<channel>) from the Network Management. If the indicated ComM channel is a managed channel, the ComM module shall request Nm_PassiveStartup(<referencing managing channel>) (see [ECUC_ComM_00893]) from the Network Management.⌋

**[SWS_ComM_01016]** ⌈If the indicated ComM channel is a managed channel, the ComM module shall request Nm_PassiveStartup(<referencing managing channel>) (see [ECUC_ComM_00893]) from the Network Management.⌋

**[SWS_ComM_00902]**

*Upstream requirements:* SRS_ModeMgm_09132

⌈On entering sub-state `COMM_FULL_COM_NETWORK_REQUESTED` and Nm module has indicated a restart, ComM_Nm_RestartIndication(<channel>) ([SWS_ComM_00792]), the ComM module shall request Nm_PassiveStartup(<channel>) from the Network Management⌋

**[SWS_ComM_00903]**

*Upstream requirements:* SRS_ModeMgm_09132

⌈On entering sub-state `COMM_FULL_COM_NETWORK_REQUESTED` and Nm module has indicated a Network start, ComM_Nm_NetworkStartIndication(<channel>) ([SWS_ComM_00383]), the ComM module shall request Nm_PassiveStartup(<channel>) from the Network Management⌋

Comment for [SWS_ComM_00903]:

This is not a "normal" transition to `COMM_FULL_COMMUNICATION`, ComM handle ComM_Nm_NetworkStartIndication() as "race condition" error (see Section 7.7.1)

**[SWS_ComM_00869]**

*Upstream requirements:* SRS_ModeMgm_00049

⌈On entering sub-state `COMM_FULL_COM_NETWORK_REQUESTED` from another state or substate, if configuration parameter ComM-NmVariant=`FULL` ([ECUC_ComM_00568]) and if a user has requested ComM_RequestComMode(<user>,`COMM_FULL_COMMUNI-CATION`) ([SWS_ComM_00110]) the ComM module shall request Nm_NetworkRequest(<channel>) from the Network Management for the corresponding NM channel.⌋

Note: Additionally Nm_NetworkRequest may be invoked due to [SWS_ComM_00980].

**[SWS_ComM_00870]**

*Upstream requirements:* SRS_ModeMgm_00049

⌈On entering sub-state `COMM_FULL_COM_NETWORK_REQUESTED`, if configuration parameter ComMNmVariant=FULL ([ECUC_ComM_00568]) and the DCM has indicated ComM_DCM_ActiveDiagnostic(<channel>) ([SWS_ComM_00873]), the ComM module shall request Nm_NetworkRequest(<channel>) from the Network Management for the corresponding NM channel.⌋

**[SWS_ComM_00889]** ⌈In sub-state `COMM_FULL_COM_NETWORK_REQUESTED` and configuration parameter ComMNmVariant=`LIGHT`|`NONE` ([ECUC_ComM_00568]) and timer for `ComMTMinFullComModeDuration`([ECUC_ComM_00557])

has expired and no user request ComM_RequestComMode(<user>, `COMM_FULL_COMMUNICATION`) and the DCM does not indicate ComM_DCM_ActiveDiagnostic(<channel>)([SWS_ComM_00873]), the ComM channel state machine shall switch to sub-state `COMM_FULL_COM_READY_SLEEP`.⌋

Rationale for [SWS_ComM_00889]:

As long as timer for `ComMTMinFullComModeDuration` has not expired the sub-state shall be kept, to prevent toggling.

**[SWS_ComM_00888]** ⌈In sub-state `COMM_FULL_COM_NETWORK_REQUESTED` and configuration parameter ComMNmVariant=`FULL` (see [ECUC_ComM_00568]) and no user request ComM_RequestComMode(<user>,`COMM_FULL_COMMUNICATION`) and the DCM does not indicate ComM_DCM_ActiveDiagnostic(<channel>)(see [SWS_ComM_00873]), the ComM channel state machine shall switch to sub-state `COMM_FULL_COM_READY_SLEEP`.⌋

Rationale for [SWS_ComM_00888]:

No timer needed if AUTOSAR NM is used. This avoids redundant functionality because AUTOSAR NM also ensures this functionality

### [SWS_ComM_01017]

*Upstream requirements:* SRS_ModeMgm_09266

⌈In sub-state `COMM_FULL_COM_NETWORK_REQUESTED` and configuration parameter ComMNmVariant=`SLAVE_ACTIVE` ([ECUC_ComM_00568]) and no user request ComM_RequestComMode(<user>,`COMM_FULL_COMMUNICATION`), the ComM channel state machine shall switch to sub-state `COMM_FULL_COM_READY_SLEEP`.⌋

### [SWS_ComM_00915]

*Upstream requirements:* SRS_ModeMgm_09267

⌈In sub-state `COMM_FULL_COM_NETWORK_REQUESTED` and configuration parameter ComMNmVariant=`PASSIVE` | `SLAVE_PASSIVE` ([ECUC_ComM_00568]), the ComM channel state machine shall switch to sub-state `COMM_FULL_COM_READY_SLEEP`.⌋

### [SWS_ComM_00890]

*Upstream requirements:* SRS_ModeMgm_09071, SRS_ModeMgm_09087

⌈In sub-state `COMM_FULL_COM_NETWORK_REQUESTED` and the DCM does not indicate ComM_DCM_ActiveDiagnostic(<channel>)(see [SWS_ComM_00873]) and communication limitation is requested (see section [REF]), ComM channel state machine shall immediately switch to sub-state `COMM_FULL_COM_READY_SLEEP` and cancel the timer for `ComMTMinFullComModeDuration`.⌋

### 7.2.4.2 COMM_FULL_COM_READY_SLEEP sub-state

**[SWS_ComM_00133]**

Upstream requirements: SRS_ModeMgm_09132

⌈On entering sub-state COMM_FULL_COM_READY_SLEEP and configuration parameter ComMNmVariant=FULL (see [ECUC_ComM_00568]), the ComM module shall request Nm_NetworkRelease() from the Network Management for the corresponding NM channels.⌋

**[SWS_ComM_00891]** ⌈On entering sub-state COMM_FULL_COM_READY_SLEEP and configuration parameter ComMNmVariant=LIGHT (see [ECUC_ComM_00568]), the timer for ComMNmLightTimeout (see [ECUC_ComM_00606]) shall be started.⌋

**[SWS_ComM_00610]** ⌈In sub-state COMM_FULL_COM_READY_SLEEP and configuration parameter ComMNmVariant=LIGHT (see [ECUC_ComM_00568]), this ComMChannel has no PNC relation (either ComMPncSupport is set to FALSE or this ComMChannel is not referenced by a PNC) and the timer for ComMNmLightTimeout (see [ECUC_ComM_00606]) has expired, the ComM channel state machine shall switch to state COMM_NO_COMMUNICATION.⌋

**[SWS_ComM_01095]** ⌈In sub-state COMM_FULL_COM_READY_SLEEP and configuration parameter ComMNmVariant=LIGHT (see [ECUC_ComM_00568]), this ComMChannel is referenced by a PNC and the timer for ComMNmLightTimeout (see [ECUC_ComM_00606]) has expired, the ComM channel state machine shall switch to state COMM_NO_COMMUNICATION as soon as all referencing PNCs reside in COMM_PNC_NO_COMMUNICATION.⌋

Note: [SWS_ComM_01095] prevents a ComMChannel to transit to COMM_NO_COMMUNICATION, if this ComMChannel acts in the role of a managed channel, this ComMChannel is referenced by at least one PNC and the PNC is requested passively (PNC reside in COMM_PNC_READY_SLEEP).

**[SWS_ComM_01096]** ⌈In sub-state COMM_FULL_COM_READY_SLEEP and configuration parameter ComMNmVariant=LIGHT (see [ECUC_ComM_00568]), this ComMChannel act in role of an managed channel and is referenced by a ComMChannel in the role of a managing channel but not referenced by any PNC and the timer for ComMNmLightTimeout (see [ECUC_ComM_00606]) has expired, the ComM channel state machine shall switch to state COMM_NO_COMMUNICATION as soon as the referencing ComMChannel (managing channel) transit to COMM_PNC_NO_COMMUNICATION.⌋

Note: [SWS_ComM_01096] prevents a ComMChannel to transit to COMM_NO_COMMUNICATION, if this ComMChannel acts in the role of a managed channel, this ComMChannel is referenced by a ComMChannel in the role of a managing channel without

any referencing PNC and this `ComMChannel` is requested passively (ComM channel statemachine reside in `COMM_FULL_COM_READY_SLEEP`).

**[SWS_ComM_00671]** ⌈In sub-state `COMM_FULL_COM_READY_SLEEP` and configuration parameter ComMBusType=`COMM_BUS_TYPE_INTERNAL` ([ECUC_ComM_00567]), the ComM channel state machine shall immediately switch to state `COMM_NO_COMMUNICATION`.⌋

**[SWS_ComM_00882]** ⌈In sub-state `COMM_FULL_COM_READY_SLEEP` and a user request `COMM_FULL_COMMUNICATION` and communication limitation is disabled (see Section [REF]), the ComM channel state machine shall immediately switch to sub-state `COMM_FULL_COM_NETWORK_REQUESTED`.⌋

**[SWS_ComM_00883]** ⌈In sub-state `COMM_FULL_COM_READY_SLEEP`, configuration parameter ComMNmVariant=`FULL`|`LIGHT`|`NONE` ([ECUC_ComM_00568]) and DCM indicate ComM_DCM_ActiveDiagnostic([SWS_ComM_00873]), the ComM channel state machine shall switch to sub-state `COMM_FULL_COM_NETWORK_REQUESTED`.⌋

Rationale for [SWS_ComM_00883]: A potential communication limitation (see Section [REF]) shall temporarily be inactive during an active diagnostic session, see [SWS_ComM_00182]

**[SWS_ComM_00892]** ⌈In sub-state `COMM_FULL_COM_READY_SLEEP` and configuration parameter ComMNmVariant=LIGHT ([ECUC_ComM_00568]) and a switch to sub-state `COMM_FULL_COM_NETWORK_REQUESTED`, due to request for `COMM_FULL_COMMUNICATION` according to requirements in [SWS_ComM_00882] or [SWS_ComM_00883], the timer for `ComMNmLightTimeout` ([ECUC_ComM_00606]) shall be canceled.⌋

## 7.3 ComM User to PNC Relations

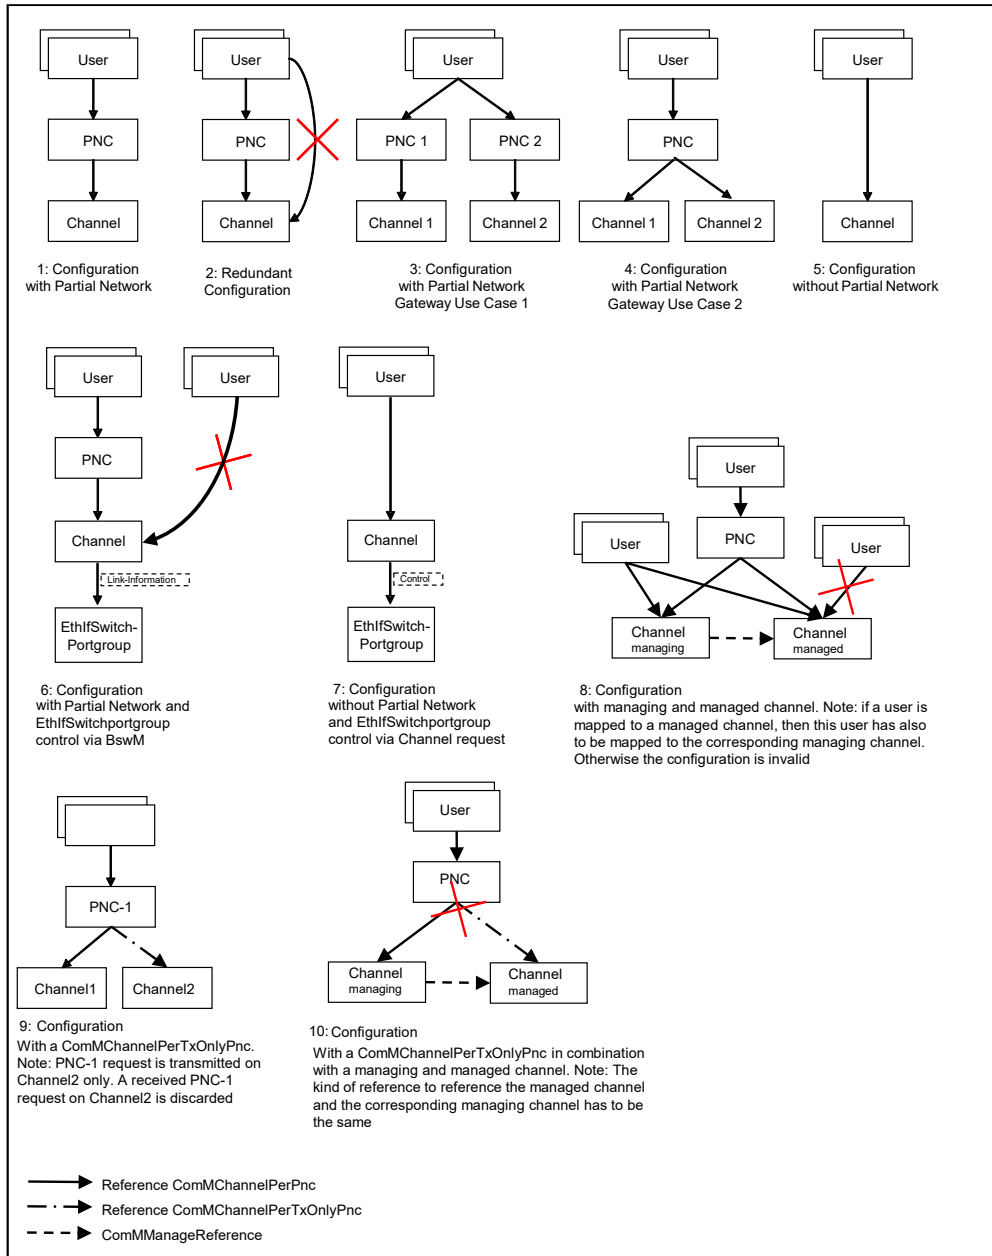

**Figure 7.8: User to Partial network and channel Mapping Use Cases**

**[SWS_ComM_00994]** ⌈No restrictions from the configuration of the <Bus>Nm Filter for partial networking shall apply to ComM user assignment to PNCs.⌋

Comment: The <Bus>NM Filter configuration shall be independent from the ComM PNC configuration.

Rational: This enables waking up a PNC without being a member of the PNC, e.g. if a node just triggers a wake up of a PNC but the node is not kept awake by the PNC and other nodes keep the PNC awake

**[SWS_ComM_00995]**

*Upstream requirements:* SRS_ModeMgm_09133, SRS_ModeMgm_09090

⌈It shall be possible to map a configurable amount of `ComMUser`s to one or more ComM channels using the parameter ComMUserPerChannel.⌋

Comment:

1. The existing mapping of ComM users to system channels shall still be possible for backward compatibility. (i.e. the configuration containers will stay untouched)

2. In a multi channel system each user can be assigned to one or more channels. If the user requests a mode, all channels assigned to this user, shall switch to the corresponding mode. All other channels shall not be affected.

1

**[SWS_ComM_00912]**

*Upstream requirements:* SRS_ModeMgm_09246

⌈It shall be possible to map a configurable amount of `ComMUser`s to one or more PNCs using the parameter ComMUserPerPnc (see [ECUC_ComM_00876]).⌋

**[SWS_ComM_01094]**

*Upstream requirements:* SRS_ModeMgm_09246

⌈It shall be possible to map a configurable amount of PNC(s) to a configurable amount of ComM channels by using the parameter `ComMChannelPerPnc` (see [ECUC_ComM_00880]) or `ComMChannelPerTxOnlyPnc` (see [ECUC_ComM_00900]). The mapping shall be possible for all `ComMChannel`s in combination with the following ComMNmVariants:

- ComMVariant=`FULL`

- ComMVariant=`LIGHT`, if the `ComMChannel` is in the role of a managed `ComMChannel` and the corresponding managing `ComMChannel` is also mapped to this PNC

⌋

Note to [SWS_ComM_01094]: For more details regarding managed and managing ComM channels refer to Section 7.2.1

**[SWS_ComM_00996]**

*Upstream requirements:* SRS_ModeMgm_09246

⌈It shall not be possible to map a `ComMUser`s to a PNC and in addition to a ComM channel which is already referenced by the PNC.⌋

Rational for [SWS_ComM_00996]: Avoid redundant configuration since the channel is implicitly already referenced by the PNC.

Note on [SWS_ComM_00996]: For more details refer to Figure 7.8 "use case 2"

**[SWS_ComM_CONSTR_00001]** ⌈ComM channel's that are referenced by a PNC are not allowed to be referenced by any `ComMUser`s, if the PNC references at least one EthIfSwitchPortGroup . A configuration tool shall reject such a configuration as invalid (error). This constraint is only valid for a host ecu that control an Ethernet switch. In all other UseCases `ComMChannel`s can be referenced by a PNC's and `ComMUser`s.⌋

Rational on [SWS_ComM_CONSTR_00001]: If using PN in combination with `EthIfSwitchPortGroup`s (derivation from a SystemDescriptionExtract if EcuInstance.ethSwitchPortGroupDerivation is set to TRUE), then the `EthIfSwitchPortGroup`s are switched by the EthIf_SwitchPortGroupRequestMode API and not by a channel request.

Note for [SWS_ComM_CONSTR_00001]: For more details refer to Figure 7.8 "use Case 6".

**[SWS_ComM_CONSTR_00002]** ⌈If a ComM user reference a managed channel, then this ComM user shall also reference the corresponding managing channel. Otherwise the configuration is invalid. A configuration tool shall reject a configuration as invalid (error), if a user references a managed channel without referencing the corresponding managing channel.⌋

**[SWS_ComM_CONSTR_00003]**

*Status:* DRAFT

⌈ComM channels with ComMNmVariant = `SLAVE_PASSIVE` are not allowed to be referenced by any `ComMUser` or PNC. A configuration tool shall reject such a configuration as invalid (error).⌋

Rational: ComM channels with ComMNmVariant = `SLAVE_PASSIVE` shall always follow the communication request of their communication master and are not allowed to request the corresponding master to wake-up the communication channel.

**[SWS_ComM_CONSTR_00005]** ⌈If a PNC references a ComM channel, then this PNC shall reference that ComM channel either using `ComMChannelPerPnc` or `ComMChannelPerTxOnlyPnc`, but not both. Otherwise the configuration is invalid. A configuration tool shall reject such a configuration as invalid (error).⌋

**[SWS_ComM_CONSTR_00006]** ⌈The kind of reference (either `ComMChannelPerPnc` or `ComMChannelPerTxOnlyPnc`) from a PNC to a managed channel and the corresponding managing channel shall be the same. Otherwise the configuration is invalid. A configuration tool shall reject such a configuration as invalid (error).⌋

## 7.4 Extended functionality

**[SWS_ComM_00470]**

*Upstream requirements:* SRS_ModeMgm_09071, SRS_ModeMgm_09157, SRS_ModeMgm_09089, SRS_ModeMgm_09155

⌈The extended functionality described in this chapter shall be

individually configurable during runtime per feature (e.g. enable wake up

inhibition but disable limitation to no communication).⌋

Rationale for [SWS_ComM_00470]: During runtime a change in the inhibition / limitation strategy is required in order to cope with changing conditions.

Use Case: Change the wakeup inhibition via diagnostics.

Comment: Configurable with parameter `ComMEcuGroupClassification` (see [ECUC_ComM_00563]).

### 7.4.1 Communication inhibition

Note:

- The purpose of mode inhibition is to limit the communication capabilities. For details see Section 7.4.1.1 and Section 7.4.1.2.

- The following parameters are relevant to communication inhibition and have relationship to APIs described below:

    - `ComMNoCom`: "request bit" of mode inhibition (limit to NoCom), can be controlled by ComM_LimitChannelToNoComMode() and ComM_LimitECUToNoComMode(), only if `ComMEcuGroupClassification` enable this functionality (see [ECUC_ComM_00563], [SWS_ComM_00163], [SWS_ComM_00124]).

- – `ComMNoWakeup`: "request bit" of mode inhibition (wakeup inhibition), can be controlled by ComM_PreventWakeUp(), only if `ComMEcuGroup-Classification` enable this functionality (see [ECUC_ComM_00563], [SWS_ComM_00156]).

- – `ComMEcuGroupClassification`: "mask bits" of mode inhibition behavior, can be controlled by ComM_SetECUGroupClassification(), regardless of `ComMNoCom` and `ComMNoWakeup` values

**[SWS_ComM_00301]**

   *Upstream requirements:* SRS_ModeMgm_09071

⌈The ComM module shall offer interfaces to request and release the corresponding mode inhibitions.⌋

Comment: The ComM module doesn't care about who requests the mode inhibition but it is not a "normal" SW-C. It is a privileged SW-C or an OEM specific BSW.

**[SWS_ComM_00488]**

   *Upstream requirements:* SRS_ModeMgm_09071

⌈It shall be possible to enable and disable the mode inhibition for each channel (channel state machine) independently. This functionality shall not be used by the ComM module itself.⌋

**[SWS_ComM_00839]**

   *Upstream requirements:* SRS_ModeMgm_09155

⌈The ComM module shall store the status of the user requests.⌋

Comment: [SWS_ComM_00839] describes the desired behaviour during an active mode limitation.

**[SWS_ComM_00840]**

   *Upstream requirements:* SRS_ModeMgm_09155, SRS_ModeMgm_09071, SRS_ModeMgm_-09157

⌈The ComM module shall store the updated status of the user requests if a user releases a request during an active mode inhibition.⌋

Rationale for [SWS_ComM_00840]: User requests shall be granted if the inhibition gets disabled.

Comment: Amount of active user requests from different users. [SWS_ComM_00840] describes the desired behaviour during an active mode limitation.

**[SWS_ComM_00182]**

  *Upstream requirements:* SRS_ModeMgm_09157

⌈The communication inhibition shall get temporarily inactive during an active diagnostic session.⌋

Rationale for [SWS_ComM_00182]: ECUs must not fall asleep during an active diagnostic session.

Comment: The DCM indicates the start of an active diagnostic session with ComM_DCM_ActiveDiagnostic(<channel>)([SWS_ComM_00873]) and the end of a diagnostic session with ComM_DCM_InactiveDiagnostic(<channel>)([SWS_ComM_00874]).

### 7.4.1.1 Bus wake up inhibition

Information: Bus wake up inhibition in context of the ComM module means that the ComM module should take precautions against awaking other ECUs by starting the communication.

Rationale: Awaking other ECUs by communication should be avoided because it is assumed that the ECU wakes up the bus because of an error (e.g. broken sensor).

Use Case: An error was detected on signal path of an active wake up line and this non reliable wake-up-source should not be able to awake the whole system anymore. An SW-C that controls error-reactions could set the wake up inhibition-status of related communication channels that usually get communication-requests from SW-Cs as the consequence of this event. This corrupts the forwarding of communication system-wide, based on unreliable wake up events. Or in case of application-specific system control, there is an SW-C that should switch off forwarding system wide wakeup's by communication under conditions like e.g. transport mode.

**[SWS_ComM_00302]**

  *Upstream requirements:* SRS_ModeMgm_09089, SRS_ModeMgm_09141

⌈Bus wake up Inhibition shall be performed by ignoring user requests.⌋

Comment: Ignoring user requests means accepting the requests but not executing them due to mode inhibition. The "highest win" strategy would apply immediately as soon as mode inhibition is switched off (see [SWS_ComM_00839] and [SWS_ComM_00840]).

**[SWS_ComM_00218]**

  *Upstream requirements:* SRS_ModeMgm_09141

⌈A communication request (`COMM_FULL_COMMUNICATION`) by a user shall be inhibited if the ComM Inhibition status is equal to `ComMNoWakeup` is set to TRUE (see

[ECUC_ComM_00569]) for the corresponding channel and the current state of the channel is `COMM_NO_COMMUNICATION` or `COMM_SILENT_COMMUNICATION`⌋

Rationale for [SWS_ComM_00218]: The inhibition should not get active, if the inhibition-status is set but the communication channel is already active.

**[SWS_ComM_00219]**

   *Upstream requirements:* SRS_ModeMgm_09141

⌈The inhibition shall not get active if the current communication state is `COMM_FULL_‐ COMMUNICATION` .⌋

Rationale for [SWS_ComM_00219]: The bus is already awake if the current communication state is `COMM_FULL_COMMUNICATION`.

**[SWS_ComM_00066]**

   *Upstream requirements:* SRS_ModeMgm_09071, SRS_ModeMgm_09141

⌈The ComM module shall never inhibit the "passive wake-up" capability.⌋

Rationale for [SWS_ComM_00066]: It must be always possible to react on bus wake ups indicated by the EcuM module.

Comment: Reception is switched off in `COMM_NO_COMMUNICATION` mode but the wake up capability is switched on.

**[SWS_ComM_00157]**

   *Upstream requirements:* SRS_ModeMgm_09089, SRS_ModeMgm_09141

⌈`ComMNoWakeup` status must be stored non volatile.⌋

Rationale for [SWS_ComM_00157]: Information must be available during start-up, before the communication is active ("Full Communication" mode entered). Changing or query is only possible after start-up with active communication (usually the "master", who decides if the inhibition is active or not, is not on the same ECU).

**[SWS_ComM_00625]**

   *Upstream requirements:* SRS_ModeMgm_09155, SRS_ModeMgm_09141

⌈The status of the user requests shall also be updated if a user releases a request.⌋

### 7.4.1.2 Limit to `COMM_NO_COMMUNICATION` mode

**[SWS_ComM_00303]**

*Upstream requirements:* SRS_ModeMgm_09071

⌈If the current state is `COMM_FULL_COM_NETWORK_REQUESTED` and when mode limitation to `COMM_NO_COMMUNICATION` has been requested for the corresponding channel, ComM module shall switch to `COMM_FULL_COM_READY_SLEEP` state to initiate a shutdown despite any user requests for `COMM_FULL_COMMUNICATION`.⌋

Rationale for [SWS_ComM_00303]: Forcing into `COMM_NO_COMMUNICATION` mode is needed to shut down software components, which keeps the bus awake.

Comment for [SWS_ComM_00303]: Limit to `COMM_NO_COMMUNICATION` will only be performed if a channel was request actively. In that case all current user requests for full communication or even new requests will be ignored (see also [SWS_ComM_00215]). The limit to no communication will not be performed, if a ComM channel is remotely kept awake due to a passive wakeup.

**[SWS_ComM_00842]**

*Upstream requirements:* SRS_ModeMgm_09071

⌈When ComM_LimitChannelToNoComMode() is called, ComM module shall update the inhibition status (limitation to `COMM_NO_COMMUNICATION`) for the corresponding channel.⌋

Note: An update of the inhibition status due to a request for limit to `COMM_NO_COMMUNICATION` has to be performed always, independent of the current state.

**[SWS_ComM_00355]**

*Upstream requirements:* SRS_ModeMgm_09071

⌈If `ComMResetAfterForcingNoComm` is set to TRUE ( see [ECUC_ComM_00558]) and when ComM enters `COMM_NO_COMMUNICATION` after state transition from `COMM_FULL_COM_NETWORK_REQUESTED` to `COMM_FULL_COM_READY_SLEEP` has been forced due to mode limitation to `COMM_NO_COMMUNICATION` request ( see [SWS_ComM_00303] ), then ComM shall call BswM_ComM_InitiateReset().⌋

Note: A call of BswM_ComM_InitiateReset() is the trigger for an ECU reset which has to be executed as soon as possible, depending on further needed actions (e.g. storing all NvM blocks).

Rationale: It is assumed that a faulty user will not release his "Full Communication" request without a re-initialization. Keeping the "Full Communication" request active leads to a toggling between network shutdown and network startup.

Use Case: It is assumed that a faulty ECU keeps the bus awake. As a consequence a "network master" decides to force all ECUs to go to sleep.

**[SWS_ComM_00215]**

*Upstream requirements:* SRS_ModeMgm_09071

⌈When mode limitation to `COMM_NO_COMMUNICATION` has been requested, ComM module shall ignore all user requests with `COMM_FULL_COMMUNICATION` for the corresponding channel.⌋

**[SWS_ComM_00582]**

*Upstream requirements:* SRS_ModeMgm_09078

⌈The ComM module shall clear the user requests after all the channels that belong to the corresponding user enter `COMM_NO_COMMUNICATION` mode.⌋

Rationale for [SWS_ComM_00582]: Stored (faulty) user requests, which are assumed to keep the bus awake, must be cleared.

Description: The ComM module shall reload the default value of the ComM inhibition status from `ComMNoCom` (see [ECUC_ComM_00571]) during initialization.

Comment: The current `ComMNoCom` status for each channel shall not be stored persistently. [SWS_ComM_00582] describes the desired behaviour after an executed mode limitation.

## 7.5 Bus communication management

**[SWS_ComM_00402]**

*Upstream requirements:* SRS_ModeMgm_00049, SRS_ModeMgm_09083

⌈The ComM module shall use the corresponding interfaces of the Bus State Manager modules to control the communication capabilities.⌋

**[SWS_ComM_00664]**

*Upstream requirements:* SRS_ModeMgm_09168

⌈The ComM module shall omit calls to control the communication capabilities if configuration parameter `ComMBusType`=COMM_BUS_TYPE_INTERNAL ([ECUC_ComM_00567]).⌋

Rationale for [SWS_ComM_00664]: Internal communication has no corresponding bus interface.

## 7.6 Network management dependencies

**[SWS_ComM_00599]**

*Upstream requirements:* SRS_ModeMgm_09132

⌈The ComM module shall support the shutdown synchronization variants (configured with ComMNmVariant, see [ECUC_ComM_00568]) `LIGHT`, `SLAVE_ACTIVE`, `SLAVE_PASSIVE`, `PASSIVE` and `FULL`.⌋

Comment on [SWS_ComM_00599]: Only variant `FULL` and `PASSIVE` guarantees a synchronized shutdown between all nodes of a network. Note that since the NmIf cannot start the synchronized shutdown of coordinated networks before all networks are ready to go to sleep, requests from ComM to NmIf to release network communication on such a coordinated bus will be considered, but not always acted on directly. The NmIf will still answer with E_OK, but network will not be released until all coordinated networks are ready to go to sleep.

Note on [SWS_ComM_00599]: For more details refer to Table 7.3.

| NM variant | Keep bus awake capability | Shutdown synchronization |
|---|---|---|
| `NONE` | | No shutdown synchronization by ComM. Shutdown by switching off the power of the ECU. |
| `SLAVE_ACTIVE` | No (but the corresponding master could trigger a wake-up based on a slave request for a wake-up. E.g. the LIN State Manager of a LIN master restarts wake-up repetition) | Synchronized by its master (e.g. LIN master) |
| `SLAVE_PASSIVE` | No (the slave will always follow the communication request of the corresponding master. The slave has no possibility to request a wake-up on the corresponding communication channel. | Synchronized by its master (e.g. ComM channel with `ComMBusType` set to `COMM_BUS_TYPE_ETH` and used Ethernet hardware is compliant to OA TC10 (see [2])) |
| `LIGHT` | | Shutdown synchronization by ComM with means of a timeout (configured with `ComMNmLightTimeout`, [ECUC_ComM_00606]) |
| `PASSIVE` | ECU is not allowed to keep the bus awake | Shutdown synchronization by ComM with means of AUTOSAR NM. |
| `FULL` | ECU is allowed to keep the bus awake. | Shutdown synchronization by ComM with means of AUTOSAR NM. |

**Table 7.3: Network management variants supported by the Communication Manager Module**

Comment: A synchronized shutdown is not possible with the `LIGHT` variant thus the ECU may continuously restart ("toggle") because of a message from a node shutting down later.

**[SWS_ComM_00602]**

*Upstream requirements:* SRS_ModeMgm_09132

⌈The ComM module shall omit calls of NM services if configuration parameter ComMNmVariant = LIGHT | SLAVE_ACTIVE | SLAVE_PASSIVE | NONE (see [ECUC_ComM_00568]).⌋

Rationale for [SWS_ComM_00602]: NM services are not available if no NM is available.

**[SWS_ComM_00667]**

*Upstream requirements:* SRS_ModeMgm_09132

⌈The ComM module shall omit to call Nm_NetworkRequest() from NM if configuration parameter ComMNmVariant= LIGHT|SLAVE_ACTIVE|SLAVE_PASSIVE|NONE (see [ECUC_ComM_00568]).⌋

Rationale for [SWS_ComM_00667]: Service Nm_NetworkRequest() is not available.

## 7.7 Bus error management

### 7.7.1 Network Start Indication

**[SWS_ComM_00583]**

*Upstream requirements:* SRS_ModeMgm_09132

⌈The ComM module shall switch channel X to COMM_FULL_COMMUNICATION if NM indicates ComM_Nm_NetworkStartIndication(<channel X>) and CommunicationAllowed flag is set to TRUE.⌋

Use Case for [SWS_ComM_00583]: A node sends an NM message in "Prepare Bus Sleep" state but other nodes are already in "Bus Sleep" state because of "race conditions".

## 7.8 Test support requirements

### 7.8.1 Inhibited Full Communication Request Counter

**[SWS_ComM_00138]**

*Upstream requirements:* SRS_ModeMgm_09155

⌈The ComM module shall provide one Inhibit counter for all rejected `COMM_FULL_-COMMUNICATION` mode requests. It shall count user requests, which cannot be fulfilled because the system has inhibited communication modes.⌋

Rationale for [SWS_ComM_00138]: The counter is used for detecting latent software problems related to unmotivated communication bus wake ups.

**[SWS_ComM_00140]**

*Upstream requirements:* SRS_ModeMgm_09155

⌈The Inhibit counter ([SWS_ComM_00138]) for all rejected `COMM_FULL_COMMUNICA-TION` mode requests shall be stored in non-volatile memory.⌋

**[SWS_ComM_00141]**

*Upstream requirements:* SRS_ModeMgm_09155

⌈The range of the Inhibit counter ([SWS_ComM_00138]) for all rejected `COMM_FULL_-COMMUNICATION` mode requests shall be 0 to 65535.⌋

**[SWS_ComM_00142]**

*Upstream requirements:* SRS_ModeMgm_09155

⌈The Inhibit counter ([SWS_ComM_00138]) for all rejected `COMM_FULL_COMMUNICA-TION` mode requests shall stop to increment if the maximum counter value is reached.⌋

**[SWS_ComM_00143]**

*Upstream requirements:* SRS_ModeMgm_09156

⌈It shall be possible to read out and reset the Inhibit counter ([SWS_ComM_00138]) for all rejected `COMM_FULL_COMMUNICATION` mode requests value by a ComM module API call.⌋

Use Case for [SWS_ComM_00143]: It shall be possible to read out and reset the current status of the counter by a diagnostic service.

## 7.9 Error Classification

Section "Error Handling" of the document [6] "General Specification of Basic Software Modules" describes the error handling of the Basic Software in detail. Above all, it constitutes a classification scheme consisting of five error types which may occur in BSW modules.

Based on this foundation, the following section specifies particular errors arranged in the respective subsections below.

### 7.9.1 Development Errors

**[SWS_ComM_00234] Definiton of development errors in module ComM**

*Upstream requirements:* SRS_BSW_00323, SRS_BSW_00327, SRS_BSW_00337, SRS_BSW_-00385, SRS_BSW_00386

⌈

| Type of error | Related error code | Error value |
|---|---|---|
| API service used without module initialization | COMM_E_UNINIT | 0x1 |
| API service used with wrong parameters | COMM_E_WRONG_PARAMETERS | 0x2 |
| API Service used with a null pointer | COMM_E_PARAM_POINTER | 0x3 |
| Initialization failed | COMM_E_INIT_FAILED | 0x4 |

⌋

**[SWS_ComM_00612]**

*Upstream requirements:* SRS_BSW_00406

⌈If ComM is not initialized, all ComM module and all API service other than ComM_Init() (see [SWS_ComM_00146]), ComM_GetVersionInfo() (see [SWS_ComM_00370]) and ComM_GetStatus() (see [SWS_ComM_00242]); shall:

- not execute their normal operation,

- and return E_NOT_OK, if it has a standard return type.

⌋

**[SWS_ComM_00858]**

*Upstream requirements:* SRS_BSW_00406

⌈If development error detection is enabled by ComMDevErrorDetect (see [ECUC_ComM_00555]): the function shall check that the service ComM_Init was previously called. If the check fails, the function shall raise the development error COMM_E_UNINIT⌋

### 7.9.2   Runtime Errors

**[SWS_ComM_91110] Definiton of runtime errors in module ComM** ⌈

| Type of error | Related error code | Error value |
|---|---|---|
| Reading of data from NVRAM failed | COMM_E_READ_NV_FAILED | 0x01 |

⌋

### 7.9.3   Production Errors

There are no production errors.

### 7.9.4   Extended Production Errors

There are no extended production errors.

## 7.10   Communication Manager Module Services

This section defines the AUTOSAR Interfaces of the Communication Manager Module Service (ComM).

### 7.10.1   Architecture

The overall architecture of the Communication Manager Module service is depicted in Figure 7.9:
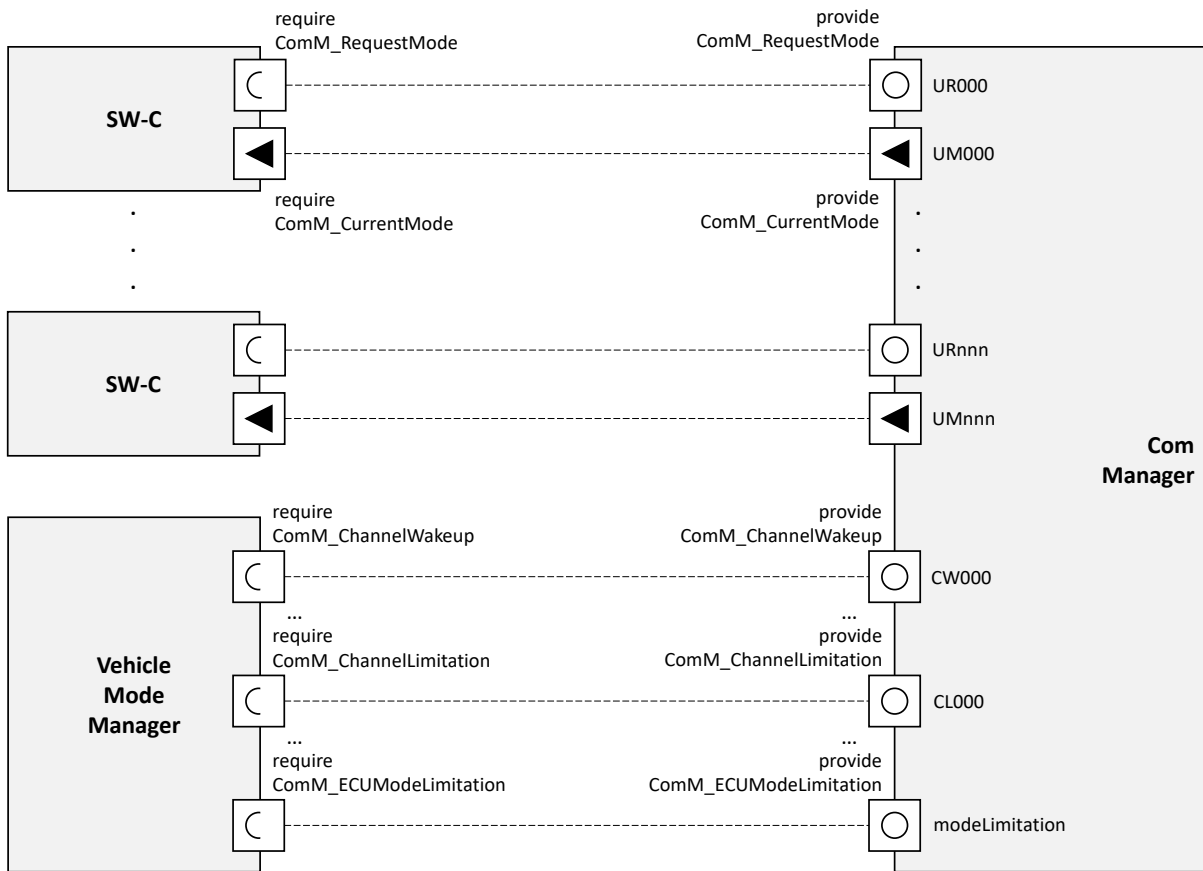

**Figure 7.9: ARPackage of the Communication Manager Module**

### 7.10.2 Use Cases

#### 7.10.2.1 SW-Cs does not care about the ComM module at all

A SW-C that does not care about the Communication Manager Module will not require any of the interfaces defined in the ARPackage of the Communication Manager Module.

#### 7.10.2.2 SW-Cs only cares about the state of its communication system

In this use case, a SW-C wants to know what communication capabilities it has (expressed by a communication mode 'none', 'silent' or 'full' - see `ComM_Mode-Type`). The SW-C finds out about that by defining a port requiring the Interface ComM_GetCurrentComMode. Depending on the available communication capabilities, the SW-C can specify that certain runnables of the SW-C should be executed or not. The Communication Manager Module must be configured correctly (with e.g. the physical channels that this SW-C uses for its logical communication) such that it has a port that provides this information about the current communication mode to the SW-C.
**Figure 7.10: SW-C requests state changes to the Communication Manager Module**

### 7.10.2.3 SW-Cs explicitly wants to take influence on its communication state

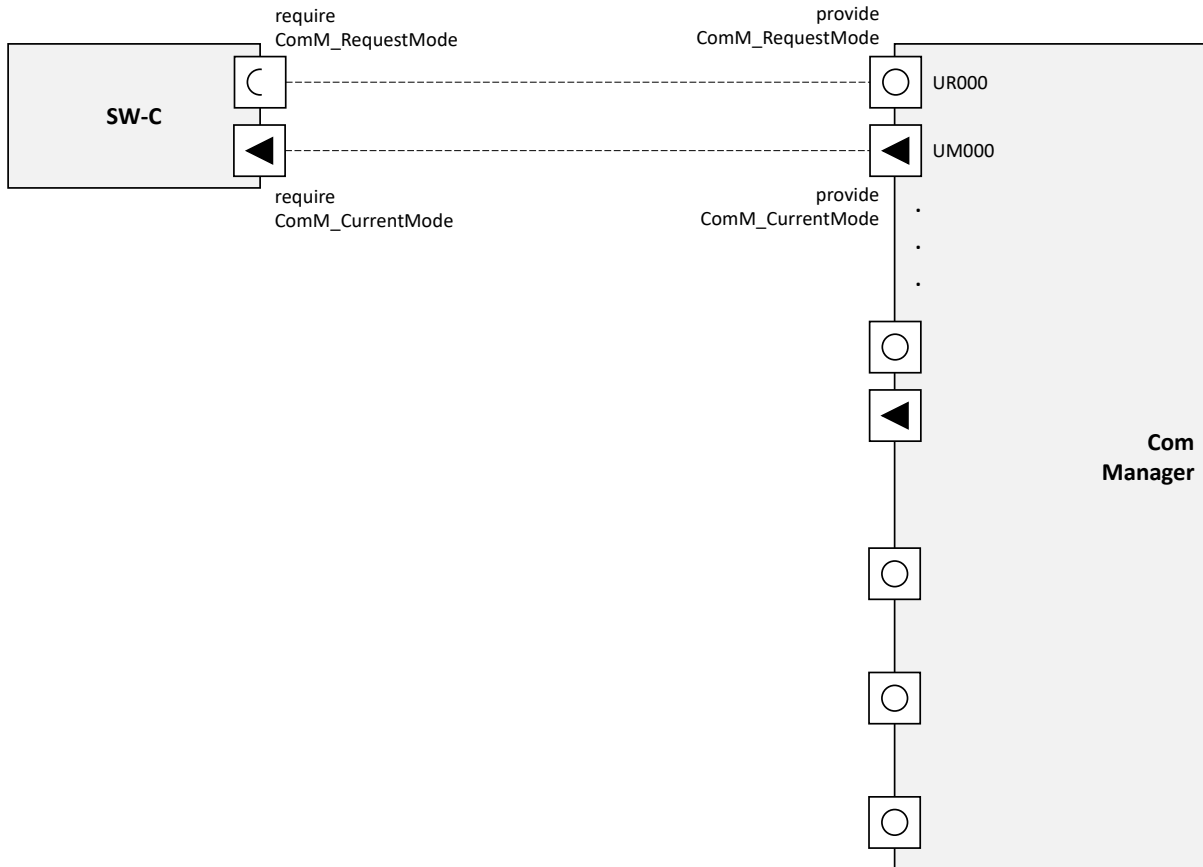

**Figure 7.11: SW-C requires state changes within the Communication Manager Module and reads out current communication state**

In this use case, the SW-C wants to explicitly take influence on the communication-state of the physical channels it needs. The SW-C indicates this by a specific port. Through this port, the SW-C can then request the Communication Manager Module mode "No Communication" or "Full Communication". The Communication Manager Module will use these calls to request the corresponding communication mode from the corresponding Bus State Manager module.

**[SWS_ComM_00848]**

*Upstream requirements:* SRS_ModeMgm_09078

⌈The Communication Manager Module shall provide an AUTOSAR port to allow the request of an communication mode by calling 'ComM_RequestComMode' (see [SWS_ComM_00110]).⌋

For a SW-C using the "direct API" of the RTE, the SW-C could for example do the following:

```
1 MySW-C_Runnable_Init(self)
2 {
```

```
 3       // SW-C wants to send and receive data
 4       e = Rte_Call_comRequest_RequestComMode(COMM_FULL_COMMUNICATION);
 5       if (e == RTE_E_OK)
 6       {
 7           // successfully requested the Com Manager Module to move to
 8           // full communication mode
 9       }
10       else
11       {
12           // an error occurred when
13           // interacting with the Com Manager module
14           if (e == E_MODE_LIMITATION)
15           {
16               // a current ComMMode limitation forbids going into
17               // that mode;
18               // let's ask what the maximal allowed ComMMode is
19               Rte_Call_comRequest_GetMaxComMode(&max);
20               if (max==COMM_NO_COMMUNICATION)
21               {
22                   ...
23               };
24           }
25           else
26           {
27               // a more serious error occurred ...
28           };
29       };
30   ...
31   };
32   MySW-C_Runnable_Loop(self)
33   {
34       if (status == ready_to_sleep)
35       {
36           //no need to send; ready for shutdown communication
37           Rte_Call_comRequest_RequestComMode(COMM_NO_COMMUNICATION);
38           ...
39       };
40   };
```

Comment: Note that these APIs do not require that the SW-C has knowledge of the channels that it needs.

#### 7.10.2.4 SW-C wants to interact directly with physical channels activate ECU Mode Limitation

The SW-C shall request mode from BswM. BswM will handle the direct communication with ComM.
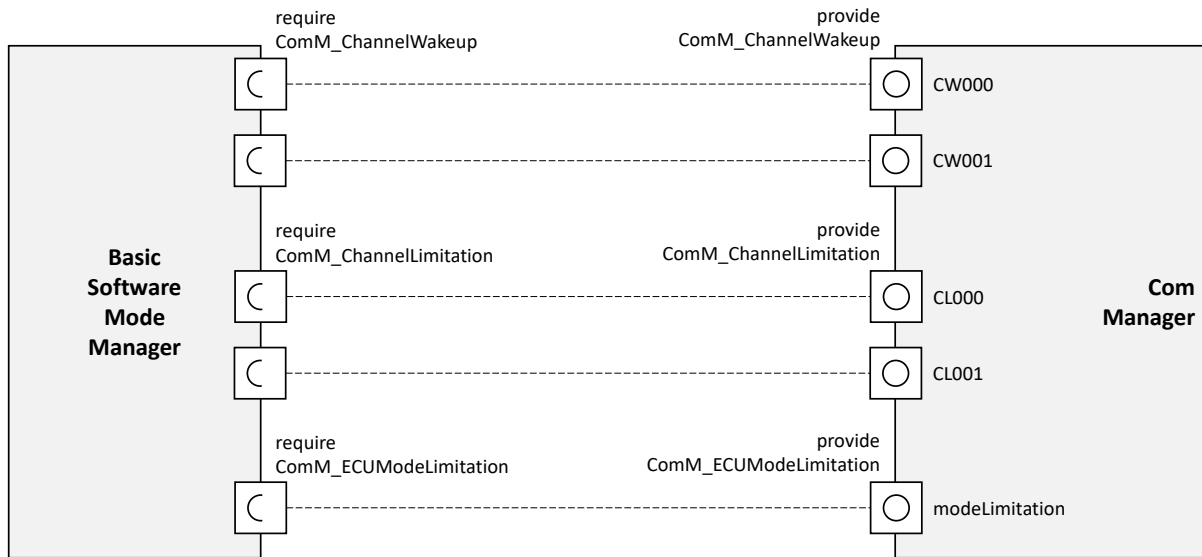

**Figure 7.12: Interaction between BswM and the ComM module**

### 7.10.3 Specification of Ports and Port Interfaces

This section specifies the Port Interfaces that are needed to operate the Communication Manager Module functionality over the RTE.

#### 7.10.3.1 Types used by the interfaces

See 8.7.4 "Implementation Data Types".

#### 7.10.3.2 Ports and Port Interface for User Requests

##### 7.10.3.2.1 General Approach

A SW-C that wants to explicitly direct the local Communication Manager Module of the ECU towards a certain state requires the client-server interface ComM_UserRequest. Through this interface the SW-C can set the desired state of all communication channels that are relevant for that component, to "No Communication" or "Full Communication". In order to keep the SW-Cs code independent from the values of the handles that are used to identify the user towards the Communication Manager Module, these handles are not passed from the SW-C to the Communication Manager Module. Rather they are modeled as "port defined argument values" of the Provide Ports on the Communication Manager Module's side. As a consequence, these handles do not show up as arguments in the operations of the client-server interface ComM_UserRequest. As a further consequence of this approach, the Communication Manager Module has a separate port for each user.

### 7.10.3.2.2   Data Types

No data types are needed for this interface.

### 7.10.3.2.3   Port interface ComM_UserRequest

See 8.7.2.4 "ComM_UserRequest".

## 7.10.3.3   Ports and Port Interfaces for the current mode of the Communication Manager Module

### 7.10.3.3.1   General approach

**[SWS_ComM_00847]**

*Upstream requirements:* SRS_ModeMgm_09085

⌈The Communication Manager Module shall have an AUTOSAR port providing the ModeSwitchInterface interface 'ComM_CurrentMode'.⌋

**[SWS_ComM_00733]**

*Upstream requirements:* SRS_ModeMgm_09085

⌈The Communication Manager Module shall have a separate port providing the ModeSwitchInterface interface 'ComM_CurrentMode' for each configured user, to which a SW-C is connected.⌋

A SW-C that wants to get informed about its current Communication Manager Module Mode requires the ModeSwitchInterface interface ComM_CurrentMode.

### 7.10.3.3.2   Port interface ComM_CurrentMode

See 8.7.3.1 "ComM_CurrentMode".

### 7.10.3.4 Ports and Port Interfaces for the ComM users currently requesting `COMM_FULL_COMMUNICATION`

#### 7.10.3.4.1 General approach

**[SWS_ComM_00734]**

*Upstream requirements:* SRS_ModeMgm_09084

⌈The Communication Manager Module shall have an optional (see [ECUC_ComM_00787]) separate port providing the sender-receiver interface 'ComM_CurrentChannelRequest' for each configured ComM channel.⌋

Rationale for [SWS_ComM_00734]: A SW-C that wants to get informed about, which users are currently requesting `COMM_FULL_COMMUNICATION` requires the sender-receiver interface ComM_CurrentChannelRequest'.

**[SWS_ComM_00736]**

*Upstream requirements:* SRS_ModeMgm_09078

⌈Whenever the set of ComM users currently requesting `COMM_FULL_COMMUNICA-TION` for a channel changes, the Communication Manager Module shall update the data element fullComRequestors. A change shall update the data element only, when the Communication Manager Module accepts the communication request of the ComM user.⌋

Note: Requests which are accepted but not processed because of active ModeLimitations will lead to an update of the data element.

#### 7.10.3.4.2 Data Types

See 8.7.4.4 "ComM_UserHandleArrayType".

#### 7.10.3.4.3 Port Interface ComM_CurrentChannelRequest

See 8.7.1.1 "ComM_CurrentChannelRequest".

### 7.10.3.5 Ports and Port Interface for ECU Mode Limitation

#### 7.10.3.5.1 General approach

**[SWS_ComM_00740]**

*Upstream requirements:* SRS_ModeMgm_09071

⌈The Communication Manager Module can be configured to have an AUTOSAR port providing the client-server interface ComM_ECUModeLimitation.⌋

A SW-C, which plays the role of a "Mode Manager", can use this interface to change the behaviour of the entire ECU.

#### 7.10.3.5.2 Port interface ComM_ECUModeLimitation

See 8.7.2.3 "ComM_ECUModeLimitation".

### 7.10.3.6 Ports and Port Interface for Channel Wake up

#### 7.10.3.6.1 General approach

**[SWS_ComM_00747]**

*Upstream requirements:* SRS_ModeMgm_09089

⌈The Communication Manager Module can be configured to have an AUTOSAR port providing the Client-Server Interface ComM_ChannelWakeup.⌋

A SW-C playing the role of a "Mode Manager" can use this interface to configure the Communication Manager Module to take precautions against awaking other ECU's by starting the communication. In order to keep the SW-Cs code independent from the values of the handles that are used to identify a specific handle towards the Communication Manager Module, these handles are not passed from the SW-C to the Communication Manager Module. Rather they are modeled as "port defined argument values" of the Provide Ports on the Communication Manager Module's side. As a consequence, these handles do not show up as arguments in the operations of the client-server interface ComM_ChannelWakeup. As a further consequence of this approach, the Communication Manager Module has separate ports for each channel.

#### 7.10.3.6.2 Port interface ComM_ChannelWakeup

See 8.7.2.2 "ComM_ChannelWakeup".

### 7.10.3.7   Ports and Port Interface for interface Channel Limitation

#### 7.10.3.7.1   General approach

**[SWS_ComM_00752]**

Upstream requirements: SRS_ModeMgm_09071

⌈The Communication Manager Module can be configured to have an AUTOSAR port providing the Client-Server Interface ComM_ChannelLimitation.⌋

A SW-C playing the role of a "Mode Manager" can use this interface to configure the Communication Manager Module to inhibit communication mode for a given channel. In order to keep the SW-Cs code independent from the values of the handles that are used to identify a specific handle towards the Communication Manager Module, these handles are not passed from the SW-C to the Communication Manager Module. Rather they are modelled as "port defined argument values" of the Provide Ports on the Communication Manager Module side. As a consequence, these handles do not show up as arguments in the operations of the client-server interface ComM_ChannelLimitation. As a further consequence of this approach, the Communication Manager Module has separate ports for each channel.

#### 7.10.3.7.2   Port interface ComM_ChannelLimitation

See 8.7.2.1 "ComM_ChannelLimitation".

### 7.10.3.8   Definition of the Service of the Communication Manager Module

This section provides guidance on the definition of the Communication Manager Module service. There are ports on both sides of the RTE. This description of the Communication Manager Module service defines the ports below the RTE. Each SW-C, which uses the Service, must contain "service ports" in its own SW-C description which will be connected to the ports of the COM Manager module, so that the RTE can be generated.

Comment: Note that these definitions can only be completed during ECU configuration (because it depends on certain configuration parameters of the Communication Manager Module, which determine the number of ports provided by the Communication Manager Module service). Also note that the implementation of an SW-C does not depend on these definitions.

92  };
```

⌋

Comment:

'modeLimitation.LimitECUToNoComMode -> LimitECUToNoComMode' is supposed to define an OperationInvokedEvent that links the OperationPrototype to the runnable entity that is supposed to be executed.

### 7.10.4.2 Header file to be included by the Communication Manager Module

The RTE deals with the Communication Manager Module as with any normal SW-C. The RTE will be able to generate a header-file based on the internal-behaviour description of the Communication Manager Module which contains for instance a definition of the API's (like Rte_Ports_CurrentMode_P) which are available to the Communication Manager Module. This implies that an implementation of the Communication Manager Module must include this generated header-file.

## 7.11 Multicore Distribution

In its role as central module dealing with different network types the ComM interaction spans across partitions in case the Com-Stack is distributed and so shall provide required multi-core features to ensure a clean architecture and keep the network dependent clusters free of multi-partition (multi-core) add-ons.

### [SWS_ComM_01019]

*Upstream requirements:* SRS_BSW_00459

⌈The ComM module shall apply appropriate mechanisms to allow calls of its APIs from other partitions than its main function, e.g. by providing a ComM satellite.⌋

### [SWS_ComM_01020]

*Upstream requirements:* SRS_BSW_00459

⌈ComM shall interact with <Bus>SM (i.e. call <Bus>SM APIs) only in the partition, where the respective <Bus>SM module is assigned to.⌋

### [SWS_ComM_01059]

*Upstream requirements:* SRS_BSW_00459

⌈ComM shall interact with Dcm (i.e. call Dcm APIs) only in the partition, where the Dcm module is assigned to.⌋

Note: Even though the basic software is distributed across several partitions, ComM and Nm Masters should reside in the same partition in order to keep mode interfaces between the two modules simple (for further information see chapter Master/Satellite-approach in [13] (Guide to BSW Distribution)).

## 7.12 Non functional requirements

**[SWS_ComM_00459]**

*Upstream requirements:* SRS_BSW_00342

⌈It shall be possible to integrate the ComM module delivered as source or object code into the AUTOSAR stack.

Rationale:

- Allow IP protection and guaranteed test coverage: object code
- Allow high efficiency and configurability at system generation time (by integrator): source code.

⌋

## 7.13 Security Events

The module does not report security events.

# 8 API specification

## 8.1 Imported types

### 8.1.1 Standard types

In this chapter all types included from the following modules are listed:

**[SWS_ComM_00820] Definition of imported datatypes of module ComM**

*Upstream requirements:* SRS_BSW_00348, SRS_BSW_00357

⌈

| Module | Header File | Imported Type |
|---|---|---|
| Comtype | ComStack_Types.h | NetworkHandleType |
| | ComStack_Types.h | PNCHandleType |
| NvM | Rte_NvM_Type.h | NvM_BlockIdType |
| | Rte_NvM_Type.h | NvM_RequestResultType |
| Std | Std_Types.h | Std_ReturnType |
| | Std_Types.h | Std_VersionInfoType |

⌋

The ComM API uses the following extension to Std_ReturnType:

**[SWS_ComM_91027] Definition of Std_ReturnType-extension for module ComM**

*Upstream requirements:* SRS_BSW_00331, SRS_BSW_00369, SRS_BSW_00377, SRS_BSW_-00441

⌈

| *Range* | COMM_E_MODE_LIMITATION | 2 | Function call has been successful but mode can not be granted because of mode inhibition. |
|---|---|---|---|

### [SWS_ComM_00162] Definition of datatype ComM_ConfigType ⌈

| Name | ComM_ConfigType | |
|---|---|---|
| Kind | Structure | |
| Elements | implementation specific | |
| | Type | – |
| | Comment | The contents of the initialization data structure are implementation specific |
| Description | This type contains the implementation-specific post build configuration structure. | |
| Available via | ComM.h | |

⌋

## 8.3 Function definitions

This is a list of functions provided for upper layer modules.

Note: All functions in this chapter requires previous initialization (ComM_Init), except the following ones:

- ComM_Init

- ComM_GetVersionInfo

### 8.3.1 ComM_Init

**[SWS_ComM_00146] Definition of API function ComM_Init**

*Upstream requirements:* SRS_BSW_00101, SRS_BSW_00358, SRS_BSW_00414

⌈

| Service Name | ComM_Init | |
|---|---|---|
| Syntax | `void ComM_Init (`<br>`  const ComM_ConfigType* ConfigPtr`<br>`)` | |
| Service ID [hex] | 0x01 | |
| Sync/Async | Synchronous | |
| Reentrancy | Non Reentrant | |
| Parameters (in) | ConfigPtr | Pointer to post-build configuration data |
| Parameters (inout) | None | |
| Parameters (out) | None | |
| Return value | None | |
| Description | Initializes the AUTOSAR Communication Manager and restarts the internal state machines. | |
| Available via | ComM.h | |

⌋

**[SWS_ComM_00793]**

*Upstream requirements:* SRS_BSW_00101

⌈Caveats of ComM_Init(): The NVRAM Manager module has to be initialized to have the possibility to "direct" access the ComM module's parameters.⌋

**[SWS_ComM_00864]**

*Upstream requirements:* SRS_BSW_00101

⌈In ComM_Init() ComM shall read non-volatile parameters specified in [SWS_ComM_00103] with the values read from non-volatile memory (NVRAM). If no parameters are available (e.g. reading of NvM Block fails), ComM shall use the default values for the initialization.⌋

**[SWS_ComM_01098]**

*Upstream requirements:* SRS_BSW_00101

⌈Default value used for initialization of the inhibition counter shall be 0.⌋

**[SWS_ComM_01099]**

*Upstream requirements:* SRS_BSW_00101

⌈Default value used for initialization of the PNC-to-channel Mapping shall be a two-dimensional array with the statically configured mapping of PNC to channels of the PNC Gateway.⌋

**[SWS_ComM_01100]**

*Upstream requirements:* SRS_BSW_00101

⌈Default value used for initialization of the PNC Membership shall be a PNC bit vector that holds the statically configured PNCs for the node.⌋

Note for [SWS_ComM_01100]: Default values for `ComMEcuGroupClassification` and inhibition status are used according to configuration parameters referenced in [SWS_ComM_00103].

**[SWS_ComM_01101]**

*Upstream requirements:* SRS_BSW_00101

⌈If reading the data from non-volatile memory (NVRAM) fails, ComM shall report the runtime error `COMM_E_READ_NV_FAILED` to DET.⌋

Note to [SWS_ComM_01101]: If ComM reports `COMM_E_READ_NV_FAILED`, an application could react on this error scenario, e.g. update PNC Membership by calling ComM_UpdatePncMembership or update PNC-to-channel Mapping by calling ComM_UpdatePncToChannelMapping.

### 8.3.2 ComM_DeInit

### [SWS_ComM_00147] Definition of API function ComM_DeInit

*Upstream requirements:* SRS_BSW_00336

⌈

| Service Name | ComM_DeInit |
|---|---|
| Syntax | `void ComM_DeInit (`<br>`  void`<br>`)` |
| Service ID [hex] | 0x02 |
| Sync/Async | Synchronous |
| Reentrancy | Non Reentrant |
| Parameters (in) | None |
| Parameters (inout) | None |
| Parameters (out) | None |
| Return value | None |
| Description | This API de-initializes the AUTOSAR Communication Manager. |
| Available via | ComM.h |

⌋

### [SWS_ComM_00794]

*Upstream requirements:* SRS_ModeMgm_09083

⌈De-initialization in ComM_DeInit() shall only be performed if all channels controlled by the ComM module are in `COMM_NO_COMMUNICATION` mode.⌋

Rationale for [SWS_ComM_00794]: Since the ComM_DeInit()API cannot return an error message, it must be assured that all channels are in `COMM_NO_COMMUNICATION` mode and `COMM_NO_COM_NO_PENDING_REQUEST` sub-state before ComM_DeInit()is called.

### [SWS_ComM_00865]

*Upstream requirements:* SRS_BSW_00406

⌈In ComM_DeInit ComM shall store non-volatile parameters specified in [SWS_ComM_00103] to NVRAM.⌋

### 8.3.3 ComM_GetStatus

## [SWS_ComM_00242] Definition of API function ComM_GetStatus

*Upstream requirements:* SRS_BSW_00406

| Service Name | ComM_GetStatus | |
|---|---|---|
| **Syntax** | `Std_ReturnType ComM_GetStatus (`<br>`    ComM_InitStatusType* Status`<br>`)` | |
| **Service ID [hex]** | 0x03 | |
| **Sync/Async** | Synchronous | |
| **Reentrancy** | Non Reentrant | |
| **Parameters (in)** | None | |
| **Parameters (inout)** | None | |
| **Parameters (out)** | Status | COMM_UNINIT: The ComM is not initialized or not usable. Default value after startup or after ComM_DeInit() is called. COMM_INIT: The ComM is initialized and usable. |
| **Return value** | Std_ReturnType | `E_OK`: Successfully return of initialization status<br>`E_NOT_OK`: Return of initialization status failed |
| **Description** | Returns the initialization status of the AUTOSAR Communication Manager. After a call to ComM_DeInit() ComM should have status COMM_UNINIT, and a new call to ComM_Init needed to make sure ComM restart internal state machines to defailt values. | |
| **Available via** | ComM.h | |

### 8.3.4 ComM_GetInhibitionStatus

## [SWS_ComM_00619] Definition of API function ComM_GetInhibitionStatus ⌈

| Service Name | ComM_GetInhibitionStatus | |
|---|---|---|
| **Syntax** | `Std_ReturnType ComM_GetInhibitionStatus (`<br>`    NetworkHandleType Channel,`<br>`    ComM_InhibitionStatusType* Status`<br>`)` | |
| **Service ID [hex]** | 0x04 | |
| **Sync/Async** | Synchronous | |
| **Reentrancy** | Non Reentrant | |
| **Parameters (in)** | Channel | See NetworkHandleType |
| **Parameters (inout)** | None | |
| **Parameters (out)** | Status | See ComM_InhibitionStatusType |
| **Return value** | Std_ReturnType | `E_OK`: Successfully returned Inhibition Status<br>`E_NOT_OK`: Return of Inhibition Status failed |
| **Description** | Returns the inhibition status of a ComM channel. | |
| **Available via** | ComM.h | |

### 8.3.5 ComM_RequestComMode

**[SWS_ComM_00110] Definition of API function ComM_RequestComMode**

Upstream requirements: SRS_ModeMgm_09081

⌈

| Service Name | ComM_RequestComMode |
|---|---|
| **Syntax** | `Std_ReturnType ComM_RequestComMode (`<br>`  ComM_UserHandleType User,`<br>`  ComM_ModeType ComMode`<br>`)` |
| **Service ID [hex]** | 0x05 |
| **Sync/Async** | Synchronous |
| **Reentrancy** | Reentrant |
| **Parameters (in)** | User | Handle of the user who requests a mode |
| | ComMode | COMM_FULL_COMMUNICATION COMM_NO_COMMUNICATION |
| **Parameters (inout)** | None | |
| **Parameters (out)** | None | |
| **Return value** | Std_ReturnType | `E_OK`: Successfully changed to the new mode<br>`E_NOT_OK`: Changing to the new mode failed<br>`COMM_E_MODE_LIMITATION`: Mode can not be granted because of mode inhibition. |
| **Description** | Requesting of a Communication Mode by a user.<br><br>Note:<br><br>The following modes are no vaild user requests, since they are used as internal modes:<br><br>• COMM_SILENT_COMMUNICATION (this mode is used for synchronization at shutdown)<br><br>• COMM_FULL_COMMUNICATION_WITH_WAKEUP_REQUEST (this mode is used internally within the ComM channel statemachine to trigger the lower layers to request a wakeup on the network if the used hardware support such a feature. (e.g. Ethernet hardware which is compatible with OA TC10).<br><br>The following modes are valid user requests:<br><br>• COMM_NO_COMMUNICATION<br><br>• COMM_FULL_COMMUNICATION. The communication request could also be released due to a ComM communication inhibition | |
| **Available via** | ComM.h | |

⌋

**[SWS_ComM_00795]**

Upstream requirements: SRS_ModeMgm_09090

⌈Configuration of ComM_RequestComMode: Relationship between users and channels. A user is statically mapped to one or more channels.⌋

### 8.3.6 ComM_GetMaxComMode

**[SWS_ComM_00085] Definition of API function ComM_GetMaxComMode** ⌈

| | | |
|---|---|---|
| **Service Name** | ComM_GetMaxComMode | |
| **Syntax** | `Std_ReturnType ComM_GetMaxComMode (` <br> `    ComM_UserHandleType User,` <br> `    ComM_ModeType* ComMode` <br> `)` | |
| **Service ID [hex]** | 0x06 | |
| **Sync/Async** | Synchronous | |
| **Reentrancy** | Reentrant | |
| **Parameters (in)** | User | Handle of the user who requests a mode |
| **Parameters (inout)** | None | |
| **Parameters (out)** | ComMode | See ComM_ModeType |
| **Return value** | Std_ReturnType | `E_OK`: Successfully returned maximum allowed Communication Mode <br> `E_NOT_OK`: Return of maximum allowed Communication Mode failed |
| **Description** | Function to query the maximum allowed Communication Mode of the corresponding user. | |
| **Available via** | ComM.h | |

⌋

Use Case: This function provides the possibility to request the maximum possible mode (e.g. user wants to check if it is possible to get "Full Communication" mode or if a limitation/inhibition is active). This is needed for diagnosis/debugging..

**[SWS_ComM_00374]**

 *Upstream requirements:* SRS_ModeMgm_09149

⌈If more than one channel is linked to one user request and the maximum allowed modes of the channels are different, then the function ComM_GetMaxComMode shall return the lowest mode (see [SWS_ComM_00867] and [SWS_ComM_00868]).⌋

**[SWS_ComM_00796]**

 *Upstream requirements:* SRS_ModeMgm_09090

⌈Configuration of ComM_GetMaxComMode: Relationship between users and channels. A user is statically mapped to one or more channels.⌋

### 8.3.7 ComM_GetRequestedComMode

**[SWS_ComM_00079] Definition of API function ComM_GetRequestedComMode**

*Upstream requirements:* SRS_ModeMgm_09149

⌈

| Service Name | ComM_GetRequestedComMode | |
|---|---|---|
| **Syntax** | `Std_ReturnType ComM_GetRequestedComMode (`<br>`  ComM_UserHandleType User,`<br>`  ComM_ModeType* ComMode`<br>`)` | |
| **Service ID [hex]** | 0x07 | |
| **Sync/Async** | Synchronous | |
| **Reentrancy** | Reentrant | |
| **Parameters (in)** | User | Handle of the user who requests a mode |
| **Parameters (inout)** | None | |
| **Parameters (out)** | ComMode | Name of the requested mode |
| **Return value** | Std_ReturnType | `E_OK`: Successfully returned requested Communication Mode<br>`E_NOT_OK`: Return of requested Communication Mode failed |
| **Description** | Function to query the currently requested Communication Mode of the corresponding user. | |
| **Available via** | ComM.h | |

⌋

Rationale for [SWS_ComM_00079]: The requested user "Communication Mode" has to be stored volatile within the Communication Manager Module itself, to prevent redundant storage of status information by the users.

Comment: If the Communication Manager Module would not have this service every user has to store the status on its own –> redundant and possibly inconsistent storage of the same data.

Note: A user is statically mapped to one or more channels. The relationship between users and channels is reflected by the configuration (see [ECUC_ComM_00658]).

### 8.3.8 ComM_GetCurrentComMode

**[SWS_ComM_00083] Definition of API function ComM_GetCurrentComMode**

*Upstream requirements:* SRS_ModeMgm_09084

⌈

| Service Name | ComM_GetCurrentComMode | |
|---|---|---|
| **Syntax** | `Std_ReturnType ComM_GetCurrentComMode (`<br>`  ComM_UserHandleType User,`<br>`  ComM_ModeType* ComMode`<br>`)` | |
| **Service ID [hex]** | 0x08 | |
| **Sync/Async** | Synchronous | |
| **Reentrancy** | Reentrant | |
| **Parameters (in)** | User | Handle of the user who requests a mode |
| **Parameters (inout)** | None | |
| **Parameters (out)** | ComMode | See ComM_ModeType |
| **Return value** | Std_ReturnType | `E_OK`: Successfully returned Communication Mode from Bus State Manager<br>`E_NOT_OK`: Return of Communication Mode from Bus State Manager failed |
| **Description** | Function to query the current Communication Mode. ComM shall use the corresponding interfaces of the Bus State Managers to get the current Communication Mode of the network. (Call to Bus State Manager API: <Bus>SM _GetCurrentComMode(...)) | |
| **Available via** | ComM.h | |

⌋

**[SWS_ComM_00176]**

*Upstream requirements:* SRS_ModeMgm_09172

⌈If more than one channel is linked to one user request and the modes of the channels are different, the function ComM_GetCurrentComMode shall return the lowest mode (see [SWS_ComM_00867] and [SWS_ComM_00868]).⌋

**[SWS_ComM_00798]**

*Upstream requirements:* SRS_ModeMgm_09090

⌈Configuration of ComM_GetCurrentComMode: Relationship between users and channels. A user is statically mapped to one or more channels.⌋

### 8.3.9 ComM_GetCurrentPNCComMode

**[SWS_ComM_91002] Definition of API function ComM_GetCurrentPNCComMode**
⌈

| Service Name | ComM_GetCurrentPNCComMode | |
|---|---|---|
| Syntax | `Std_ReturnType ComM_GetCurrentPNCComMode (`<br>  `ComM_UserHandleType User,`<br>  `ComM_ModeType* ComMode`<br>`)` | |
| Service ID [hex] | 0x6a | |
| Sync/Async | Synchronous | |
| Reentrancy | Reentrant | |
| Parameters (in) | User | Handle of the user who requests a mode |
| Parameters (inout) | None | |
| Parameters (out) | ComMode | See ComM_ModeType |
| Return value | Std_ReturnType | `E_OK`: Successfully returned the state of the PNC referenced by the given ComMUser<br>`E_NOT_OK`: Return of the PNC state referenced by the given ComMUser failed<br>`COMM_E_MULTIPLE_PNC_ASSIGNED`: Function could not provide the current mode of the PNC, since multiple PNCs are assigned to the affected user<br>`COMM_E_NO_PNC_ASSIGNED`: Function could not provide the current mode of the PNC, since no PNC is assigned to the affected user |
| Description | The function returns the current Communication Mode of the corresponding PNC the affected user is assigned to. | |
| Available via | ComM.h | |

⌋

**[SWS_ComM_01022]**

*Upstream requirements:* SRS_ModeMgm_09149

⌈If more than one PNC is assigned to the affected user, the function ComM_GetCurrentPNCComMode shall return `COMM_E_MULTIPLE_PNC_ASSIGNED` as `ComMode` .⌋

Comment to [SWS_ComM_01022]: For multiple PNCs it is not possible to return a consistent communication mode since the PNCs could have different communication modes.

**[SWS_ComM_01023]**

*Upstream requirements:* SRS_ModeMgm_09149

⌈If no PNC is assigned to the affected user, the function ComM_GetCurrentPNCComMode shall return `COMM_E_NO_PNC_ASSIGNED` as `ComMode`.⌋

**[SWS_ComM_01024]**

*Upstream requirements:* SRS_ModeMgm_09149

⌈If [SWS_ComM_01022] and [SWS_ComM_01023] do not apply, the function shall query for the current communication mode of the corresponding PNC statemachine the user is assigned to. If the corresponding PNC statemachine is in main state `COMM_PNC_FULL_COMMUNICATION`, then the function shall return `COMM_FULL_COM-MUNICATION` as `ComMode`. If the corresponding PNC statemachine is main state COMM_PNC_NO_COMMUNCATION, then the function shall return `COMM_NO_COM-MUNICATION` as `ComMode`.⌋

Note: The service interface ComM_UserRequest provides the possibility among others to query for the current mode of a channel and to query for the current mode of a PNC. Since the service interface has `ComM_ModeType` as a return value type, the main state of the ComM PNC statemachine has to be mapped to the main state of the ComM channel statemachine

**[SWS_ComM_01025]**

*Upstream requirements:* SRS_ModeMgm_09090, SRS_ModeMgm_09246

⌈Configuration of ComM_GetCurrentPNCComMode: Relationship between users and PNCs. A user is statically mapped to one or more PNCs.⌋

### 8.3.10 ComM_GetPncToChannelMapping

**[SWS_ComM_91013] Definition of API function ComM_GetPncToChannelMapping**

*Upstream requirements:* SRS_ModeMgm_09259

⌈

| Service Name | ComM_GetPncToChannelMapping | |
|---|---|---|
| Syntax | `Std_ReturnType ComM_GetPncToChannelMapping (`<br>`  uint8* MappingTable,`<br>`  uint8* ChannelCnt,`<br>`  uint8* PNCBitVectorLength`<br>`)` | |
| Service ID [hex] | 0x68 | |
| Sync/Async | Synchronous | |
| Reentrancy | Non Reentrant | |
| Parameters (in) | None | |
| Parameters (inout) | None | |
| Parameters (out) | MappingTable | Pointer to an array of uint8 which stores for each channel a PNC bit vector representing the mapping of PNCs to the channel |

▽

△

| | ChannelCnt | Pointer to the number of physical channels passed in the MappingTable |
|---|---|---|
| | PNCBitVectorLength | Pointer to the length in bytes of the PNC bit vector where each bit represents one PNC |
| **Return value** | Std_ReturnType | `E_OK`: Successfully get PNC-to-channel-mapping entry<br>`E_NOT_OK`: Getting of PNC-to-channel-mapping entry failed<br>`COMM_E_LEARNING_ACTIVE`: Functionality cannot be executed because PNC learning phase is active. |
| **Description** | | This function returns the current configuration of the ECUs PNC-to-channel-mapping. |
| **Available via** | | ComM.h |

⌋

### [SWS_ComM_01034]

*Upstream requirements:* SRS_ModeMgm_09258

⌈Function ComM_GetPncToChannelMapping shall be only available if `ComMPncGatewayEnabled` and `ComMDynamicPncToChannelMappingSupport` are set to TRUE.⌋

### [SWS_ComM_01035]

*Upstream requirements:* SRS_ModeMgm_09259

⌈If `ComMDynamicPncToChannelMappingEnabled` is set to TRUE on at least one channel and when PNC learning phase is active, then the function ComM_GetPncToChannelMapping shall return with `COMM_E_LEARNING_ACTIVE`.⌋

### [SWS_ComM_01036]

*Upstream requirements:* SRS_ModeMgm_09259

⌈If `ComMDynamicPncToChannelMappingEnabled` is set to TRUE on at least one channel and when PNC learning phase is not active, then the function ComM_GetPncToChannelMapping shall provide within MappingTable the current PNC-to-channel mapping as a two-dimensional array where on first dimension all ComM channels where `ComMPncGatewayType` is set are handled according to their derived order in ComM and on second dimension all configured `ComMPnc` according to their order given by their `ComMPncId`. ComM shall also set the parameter `ChannelCnt` and `PNCBitVectorLength` accordingly and return with E_OK.⌋

Note: The content of this MappingTable can only be interpreted correctly by application or tester correctly if the number of Channels and PNCs and their order is known.

### 8.3.11   ComM_UpdatePncToChannelMapping

#### [SWS_ComM_91015]   Definition of API function ComM_UpdatePncToChannel Mapping

*Upstream requirements:* SRS_ModeMgm_09259

⌈

| Service Name | ComM_UpdatePncToChannelMapping | |
|---|---|---|
| Syntax | `Std_ReturnType ComM_UpdatePncToChannelMapping (`<br>`  const uint8* MappingTable,`<br>`  uint8 channelCnt,`<br>`  uint8 PNCBitVectorLength`<br>`)` | |
| Service ID [hex] | 0x62 | |
| Sync/Async | Synchronous | |
| Reentrancy | Non Reentrant | |
| Parameters (in) | MappingTable | Pointer to an array of uint8 which stores for each channel a PNC bit vector representing the mapping of PNCs to the channel |
| | channelCnt | Number of physical channels passed in the MappingTable |
| | PNCBitVectorLength | Length in bytes of the PNC bit vector where each bit represents one PNC |
| Parameters (inout) | None | |
| Parameters (out) | None | |
| Return value | Std_ReturnType | `E_OK`: Successfully set PNC-to-channel-mapping entry<br>`E_NOT_OK`: Set of PNC-to-channel-mapping entry failed<br>`COMM_E_LEARNING_ACTIVE`: Functionality cannot be executed because PNC learning phase is active. |
| Description | This function can be used to set entries within the ECUs PNC-to-channel-mapping | |
| Available via | ComM.h | |

⌋

#### [SWS_ComM_01037]

*Upstream requirements:* SRS_ModeMgm_09258

⌈Function ComM_UpdatePncToChannelMapping shall be only available if `ComMPnc-GatewayEnabled` and `ComMDynamicPncToChannelMappingSupport` are set to TRUE.⌋

#### [SWS_ComM_01038]

*Upstream requirements:* SRS_ModeMgm_09259

⌈If `ComMDynamicPncToChannelMappingEnabled` is set to TRUE on at least one channel and the function ComM_UpdatePncToChannelMapping is called, ComM shall check if ChannelCnt matches the number of ComM channels where `ComMPncGateway Type` is set and `PNCBitVectorLength` matches the length PNC bit vector. If one parameter does not match and ComMDevErrorDetect is set to TRUE, then ComM shall call Det_ReportError with `COMM_E_WRONG_PARAMETERS`. If one parameter does not match, then ComM shall return with E_NOT_OK.⌋

**[SWS_ComM_01039]**

*Upstream requirements:* SRS_ModeMgm_09259

⌈If `ComMDynamicPncToChannelMappingEnabled` is set to TRUE on at least one channel, when passed parameters match (see [SWS_ComM_01038]) and when PNC learning phase is active, then the function ComM_UpdatePncToChannelMapping shall return with `COMM_E_LEARNING_ACTIVE`.⌋

**[SWS_ComM_01040]**

*Upstream requirements:* SRS_ModeMgm_09259

⌈If `ComMDynamicPncToChannelMappingEnabled` is set to TRUE on at least one channel, when passed parameters match (see [SWS_ComM_01038]) and PNC learning phase is not active, then the function ComM_UpdatePncToChannelMapping shall merge for all PNCs the provided information with their current PNC-to-channel mappings whereby MappingTable shall be interpreted as a two-dimensional array with on first dimension all ComM channels where `ComMPncGatewayType` is set are handled according to their derived order in ComM and on second dimension all configured `ComMPnc` according to their order given by their `ComMPncId`. Additionally it shall return with E_OK.⌋

### 8.3.12 ComM_ResetPncToChannelMapping

**[SWS_ComM_91017] Definition of API function ComM_ResetPncToChannelMapping**

*Upstream requirements:* SRS_ModeMgm_09259

⌈

| Service Name | ComM_ResetPncToChannelMapping |
|---|---|
| Syntax | `Std_ReturnType ComM_ResetPncToChannelMapping (`<br>`  void`<br>`)` |
| Service ID [hex] | 0x63 |
| Sync/Async | Synchronous |
| Reentrancy | Non Reentrant |
| Parameters (in) | None |
| Parameters (inout) | None |
| Parameters (out) | None |
| Return value | Std_ReturnType | `E_OK`: Successfully reset PNC-to-channel-mapping to default<br>`E_NOT_OK`: Reset of PNC-to-channel-mapping to default failed<br>`COMM_E_LEARNING_ACTIVE`: Functionality cannot be executed because PNC learning phase is active. |
| Description | This function resets dynamic entries within the ECUs PNC-to-channel-mapping to default values |

▽

△

| Available via | ComM.h |
|---|---|

⌋

## [SWS_ComM_01041]

*Upstream requirements:* SRS_ModeMgm_09258

⌈Function ComM_ResetPncToChannelMapping shall be only available if `ComMPnc-GatewayEnabled` and `ComMDynamicPncToChannelMappingSupport` are set to TRUE.⌋

## [SWS_ComM_01042]

*Upstream requirements:* SRS_ModeMgm_09259

⌈If `ComMDynamicPncToChannelMappingEnabled` is set to TRUE on at least one channel and when PNC learning phase is active, then the function ComM_ResetPncToChannelMapping shall return with `COMM_E_LEARNING_ACTIVE`.⌋

## [SWS_ComM_01043]

*Upstream requirements:* SRS_ModeMgm_09259

⌈If `ComMDynamicPncToChannelMappingEnabled` is set to TRUE on at least one channel and when PNC learning phase is not active, then the function ComM_ResetPncToChannelMapping shall set the PNC-to-channel mappings to the default values from the original configuration (i.e. static entries) and return with E_OK.⌋

### 8.3.13 ComM_PnLearningRequest

## [SWS_ComM_91019] Definition of API function ComM_PnLearningRequest

*Upstream requirements:* SRS_ModeMgm_09260

⌈

| Service Name | ComM_PnLearningRequest |
|---|---|
| Syntax | ```Std_ReturnType ComM_PnLearningRequest (     void )``` |
| Service ID [hex] | 0x64 |
| Sync/Async | Asynchronous |
| Reentrancy | Non Reentrant |
| Parameters (in) | None |
| Parameters (inout) | None |
| Parameters (out) | None |

▽

$\triangle$

| Return value | Std_ReturnType | E_OK: Successfully started PNC Learning algorithm |
|---|---|---|
| | | E_NOT_OK: PNC Learning algorithm could not be started |
| | | COMM_E_LEARNING_ACTIVE: Functionality cannot be executed because PNC learning phase is active. |
| Description | | Triggers the NM to return into NM Repeat Message State and send the Partial Network Learning Bit (in order for receiving nodes to respond) together with the Repeat Message Request Bit (in order for receiving nodes to return into NM Repeat Message State). This function is used for the optional Dynamic PNC-to-channel-mapping feature. |
| Available via | | ComM.h |

$\rfloor$

### [SWS_ComM_01044]

*Upstream requirements:* SRS_ModeMgm_09258

$\lceil$ Function ComM_PnLearningRequest shall be only available if `ComMDynamicPncToChannelMappingSupport` is set to TRUE. $\rfloor$

### [SWS_ComM_01045]

*Upstream requirements:* SRS_ModeMgm_09260

$\lceil$ If `ComMDynamicPncToChannelMappingSupport` is set to TRUE on at least one channel and when PNC learning phase is active, then the function ComM_PnLearningRequest shall return with `COMM_E_LEARNING_ACTIVE`. $\rfloor$

### [SWS_ComM_01058]

*Upstream requirements:* SRS_ModeMgm_09260

$\lceil$ If ComM_PnLearningRequest is called, PNC learning phase is inactive and at least one ComMChannel resides in another state than `COMM_FULL_COMMUNICATION`, then the function ComM_PnLearningRequest shall return with E_NOT_OK. $\rfloor$

Note: When ComM_PnLearningRequest is called, all relevant communication channels need to be already in `COMM_FULL_COMMUNICATION` state. This could be achieved by requesting an active diagnostic session via call of ComM_DCM_ActiveDiagnostic(). The learning phase may be triggered by a diagnostic tester.

### [SWS_ComM_01046]

*Upstream requirements:* SRS_ModeMgm_09260

$\lceil$ If `ComMDynamicPncToChannelMappingSupport` is set to TRUE on at least one channel and when the PNC learning phase is not active, then the function ComM_PnLearningRequest shall call the API Nm_PnLearningRequest on all channels where `ComMDynamicPncToChannelMappingEnabled` is set to TRUE and return with E_OK. $\rfloor$

### 8.3.14 ComM_UpdatePncMembership

**[SWS_ComM_91021] Definition of API function ComM_UpdatePncMembership**

   *Upstream requirements:* SRS_ModeMgm_09263

⌈

| Service Name | ComM_UpdatePncMembership | |
|---|---|---|
| **Syntax** | `Std_ReturnType ComM_UpdatePncMembership (`<br>`  boolean Control,`<br>`  const uint8* PncMembership`<br>`)` | |
| **Service ID [hex]** | 0x65 | |
| **Sync/Async** | Synchronous | |
| **Reentrancy** | Non Reentrant | |
| **Parameters (in)** | Control | Boolean Parameter: 0 = Unset the corresponding Bits in PncBit Mask 1 = Set the corresponding Bits in PncBitMask |
| | PncMembership | Array of uint8 with <PNC Vector Length> Elements that holds the current PNC Membership of the node |
| **Parameters (inout)** | None | |
| **Parameters (out)** | None | |
| **Return value** | Std_ReturnType | `E_OK`: ComM_PncMembership successfully updated<br>`E_NOT_OK`: Error occurred while updating the PNC membership.<br>`COMM_E_LEARNING_ACTIVE`: Functionality cannot be executed because PNC learning phase is active. |
| **Description** | This function is used by SWCs to update the PNC membership which is transmitted during PNC Learning. This function is used for the optional Dynamic PNC-to-channel-mapping feature. | |
| **Available via** | ComM.h | |

⌋

**[SWS_ComM_01047]**

   *Upstream requirements:* SRS_ModeMgm_09258

⌈Function ComM_UpdatePncMembership shall be only available if `ComMDynamicP-ncToChannelMappingSupport` is set to TRUE.⌋

**[SWS_ComM_01048]**

   *Upstream requirements:* SRS_ModeMgm_09260

⌈If `ComMDynamicPncToChannelMappingSupport` is set to TRUE on at least on channel and when PNC learning phase is active, then the function ComM_UpdatePncMembership shall return with `COMM_E_LEARNING_ACTIVE`.⌋

**[SWS_ComM_01049]**

   *Upstream requirements:* SRS_ModeMgm_09260

⌈If `ComMDynamicPncToChannelMappingEnabled` is set to TRUE on at least on channel and PNC Learning phase is not active, then the function ComM_UpdatePncMembership shall perform the following actions:

- When Control = 0, then the current PNC membership shall be applied with logical AND (conjunction) operation on the parameter `PncMembership` (This clears all PNC bits of the current membership besides the one provided by the parameter)

- When Control = 1, then the current PNC membership shall be applied with logical OR (disjunction) operation on the parameter `PncMembership` (This sets additional all PNC bits provided by the parameter to the current membership)

- Return with E_OK.

⌋

### 8.3.15   ComM_PreventWakeUp

**[SWS_ComM_00156] Definition of API function ComM_PreventWakeUp**

*Upstream requirements:* SRS_ModeMgm_09157

⌈

| Service Name | ComM_PreventWakeUp | |
|---|---|---|
| Syntax | `Std_ReturnType ComM_PreventWakeUp (`<br>`  NetworkHandleType Channel,`<br>`  boolean Status`<br>`)` | |
| Service ID [hex] | 0x09 | |
| Sync/Async | Synchronous | |
| Reentrancy | Non Reentrant | |
| Parameters (in) | Channel | See NetworkHandleType |
| | Status | FALSE: Wake up inhibition is switched off TRUE: Wake up inhibition is switched on |
| Parameters (inout) | None | |
| Parameters (out) | None | |
| Return value | Std_ReturnType | `E_OK`: Successfully changed wake up status for the channel `E_NOT_OK`: Change of wake up status for the channel failed, e.g. ComMEcuGroupClassification disables the functionality (see ECUC_ComM_00563) |
| Description | Changes the inhibition status COMM_NO_WAKEUP for the corresponding channel. | |
| Available via | ComM.h | |

⌋

**[SWS_ComM_00799]**

*Upstream requirements:* SRS_ModeMgm_09089

⌈Configuration of ComM_PreventWakeUp: Configurable with `ComMWakeupInhibitionEnabled` (see [ECUC_ComM_00559]).⌋

### 8.3.16 ComM_LimitChannelToNoComMode

### [SWS_ComM_00163] Definition of API function ComM_LimitChannelToNoComMode

*Upstream requirements:* SRS_ModeMgm_09157

⌈

| Service Name | ComM_LimitChannelToNoComMode | |
|---|---|---|
| Syntax | `Std_ReturnType ComM_LimitChannelToNoComMode (`<br>`  NetworkHandleType Channel,`<br>`  boolean Status`<br>`)` | |
| Service ID [hex] | 0x0b | |
| Sync/Async | Synchronous | |
| Reentrancy | Non Reentrant | |
| Parameters (in) | Channel | See NetworkHandleType |
| | Status | FALSE: Limit channel to COMM_NO_COMMUNICATION disabled TRUE: Limit channel to COMM_NO_COMMUNICATION enabled |
| Parameters (inout) | None | |
| Parameters (out) | None | |
| Return value | Std_ReturnType | `E_OK`: Successfully changed inhibition status for the channel `E_NOT_OK`: Change of inhibition status for the channel failed, e.g. ComMEcuGroupClassification disables the functionality (see ECUC_ComM_00563) |
| Description | Changes the inhibition status for the channel for changing from COMM_NO_ COMMUNICATION to a higher Communication Mode. (See also ComM_LimitECUToNoComMode, same functionality but for all channels) | |
| Available via | ComM.h | |

⌋

### [SWS_ComM_00800]

*Upstream requirements:* SRS_ModeMgm_09071

⌈Configuration of ComM_LimitChannelToNoComMode: Configurable with `ComMModeLimitationEnabled` (see [ECUC_ComM_00560]) and `ComMResetAfterForcingNoComm` (see [ECUC_ComM_00558]).⌋

### 8.3.17 ComM_LimitECUToNoComMode

**[SWS_ComM_00124] Definition of API function ComM_LimitECUToNoComMode**

*Upstream requirements:* SRS_ModeMgm_09157

⌈

| Service Name | ComM_LimitECUToNoComMode | |
|---|---|---|
| **Syntax** | `Std_ReturnType ComM_LimitECUToNoComMode (`<br>`  boolean Status`<br>`)` | |
| **Service ID [hex]** | 0x0c | |
| **Sync/Async** | Synchronous | |
| **Reentrancy** | Non Reentrant | |
| **Parameters (in)** | Status | FALSE: Limit ECU to COMM_NO_COMMUNICATION disabled<br>TRUE: Limit ECU to COMM_NO_COMMUNICATION enabled |
| **Parameters (inout)** | None | |
| **Parameters (out)** | None | |
| **Return value** | Std_ReturnType | `E_OK`: Successfully changed inhibition status for the ECU<br>`E_NOT_OK`: Change of inhibition status for the ECU failed, e.g. ComMEcuGroupClassification disables the functionality (see ECUC_ComM_00563) |
| **Description** | Changes the inhibition status for the ECU (=all channels) for changing from COMM_NO_COMMUNICATION to a higher Communication Mode. (See also ComM_LimitChannelToNoComMode, same functionality but for a specific channels) | |
| **Available via** | ComM.h | |

⌋

**[SWS_ComM_00801]**

*Upstream requirements:* SRS_ModeMgm_09071

⌈Configuration of ComM_LimitECUToNoComMode: Configurable with `ComMMode-LimitationEnabled` (see [ECUC_ComM_00560]) and `ComMResetAfterForc-ingNoComm` (see [ECUC_ComM_00558]).⌋

### 8.3.18 ComM_ReadInhibitCounter

**[SWS_ComM_00224] Definition of API function ComM_ReadInhibitCounter**

*Upstream requirements:* SRS_ModeMgm_09156

⌈

| Service Name | ComM_ReadInhibitCounter | |
|---|---|---|
| Syntax | `Std_ReturnType ComM_ReadInhibitCounter (`<br>`  uint16* CounterValue`<br>`)` | |
| Service ID [hex] | 0x0d | |
| Sync/Async | Synchronous | |
| Reentrancy | Non Reentrant | |
| Parameters (in) | None | |
| Parameters (inout) | None | |
| Parameters (out) | CounterValue | Amount of rejected COMM_FULL_COMMUNICATION user requests. |
| Return value | Std_ReturnType | `E_OK`: Successfully returned Inhibition Counter<br>`E_NOT_OK`: Return of Inhibition Counter failed |
| Description | This function returns the amount of rejected COMM_FULL_COMMUNICATION user requests. | |
| Available via | ComM.h | |

⌋

**[SWS_ComM_00802]**

*Upstream requirements:* SRS_ModeMgm_09156

⌈Configuration of ComM_ReadInhibitCounter: Configurable with `ComMModeLimitationEnabled` (see [ECUC_ComM_00560]). Function will only be available if `ComMModeLimitationEnabled` (see [ECUC_ComM_00560]) is enabled and `ComMGlobalNvMBlockDescriptor` is configured.⌋

### 8.3.19 ComM_ResetInhibitCounter

**[SWS_ComM_00108] Definition of API function ComM_ResetInhibitCounter**

*Upstream requirements:* SRS_ModeMgm_09156

⌈

| Service Name | ComM_ResetInhibitCounter |
|---|---|
| Syntax | `Std_ReturnType ComM_ResetInhibitCounter (`<br>`  void`<br>`)` |
| Service ID [hex] | 0x0e |

▽

$\triangle$

| Sync/Async | Synchronous | |
|---|---|---|
| Reentrancy | Non Reentrant | |
| Parameters (in) | None | |
| Parameters (inout) | None | |
| Parameters (out) | None | |
| Return value | Std_ReturnType | `E_OK`: Successfully reset of Inhibit `COMM_FULL_COMMUNICATION` Counter `E_NOT_OK`: Reset of Inhibit `COMM_FULL_COMMUNICATION` Counter failed |
| Description | This function resets the Inhibited COMM_FULL_COMMUNICATION request Counter. | |
| Available via | ComM.h | |

⌋

**[SWS_ComM_00803]**

*Upstream requirements:* SRS_ModeMgm_09155

⌈Configuration of ComM_ResetInhibitCounter: Configurable with `ComMModeLimitationEnabled` (see [ECUC_ComM_00560]). Function will only be available if `ComMModeLimitationEnabled` (see [ECUC_ComM_00560]) is enabled and `ComMGlobalNvMBlockDescriptor` is configured.⌋

### 8.3.20 ComM_SetECUGroupClassification

**[SWS_ComM_00552] Definition of API function ComM_SetECUGroupClassification** ⌈

| Service Name | ComM_SetECUGroupClassification | |
|---|---|---|
| Syntax | `Std_ReturnType ComM_SetECUGroupClassification (` `  ComM_InhibitionStatusType Status` `)` | |
| Service ID [hex] | 0x0f | |
| Sync/Async | Synchronous | |
| Reentrancy | Non Reentrant | |
| Parameters (in) | Status | See ComM_InhibitionStatusType |
| Parameters (inout) | None | |
| Parameters (out) | None | |
| Return value | Std_ReturnType | `E_OK`: Successfully change the ECU Group Classification Status `E_NOT_OK`: Change of the ECU Group Classification Status failed |
| Description | Changes the ECU Group Classification status (see chapter 10.2.2) | |
| Available via | ComM.h | |

⌋

### 8.3.21  ComM_GetVersionInfo

**[SWS_ComM_00370] Definition of API function ComM_GetVersionInfo**

*Upstream requirements:* SRS_BSW_00407

⌈

| Service Name | ComM_GetVersionInfo | |
|---|---|---|
| Syntax | `void ComM_GetVersionInfo (`<br>`  Std_VersionInfoType* Versioninfo`<br>`)` | |
| Service ID [hex] | 0x10 | |
| Sync/Async | Synchronous | |
| Reentrancy | Reentrant | |
| Parameters (in) | None | |
| Parameters (inout) | None | |
| Parameters (out) | Versioninfo | See Std_VersionInfoType |
| Return value | None | |
| Description | This function returns the version information of this module | |
| Available via | ComM.h | |

⌋

## 8.4  Callback notifications

**[SWS_ComM_00620]**

*Upstream requirements:* SRS_BSW_00345

⌈All the provided indication functions shall be implemented pre-compile time.⌋

Note: All functions in this chapter requires that the ComM module is initialized correctly.

### 8.4.1 AUTOSAR Network Management Interface

#### 8.4.1.1 ComM_Nm_NetworkStartIndication

**[SWS_ComM_00383] Definition of callback function ComM_Nm_NetworkStartIndication** ⌈

| Service Name | ComM_Nm_NetworkStartIndication | |
|---|---|---|
| Syntax | `void ComM_Nm_NetworkStartIndication (`<br>`  NetworkHandleType Channel`<br>`)` | |
| Service ID [hex] | 0x15 | |
| Sync/Async | Asynchronous | |
| Reentrancy | Reentrant | |
| Parameters (in) | Channel | See NetworkHandleType |
| Parameters (inout) | None | |
| Parameters (out) | None | |
| Return value | None | |
| Description | Indication that a NM-message has been received in the Bus Sleep Mode, what indicates that some nodes in the network have already entered the Network Mode. | |
| Available via | ComM_Nm.h | |

⌋

#### 8.4.1.2 ComM_Nm_NetworkMode

**[SWS_ComM_00390] Definition of callback function ComM_Nm_NetworkMode** ⌈

| Service Name | ComM_Nm_NetworkMode | |
|---|---|---|
| Syntax | `void ComM_Nm_NetworkMode (`<br>`  NetworkHandleType Channel`<br>`)` | |
| Service ID [hex] | 0x18 | |
| Sync/Async | Asynchronous | |
| Reentrancy | Reentrant | |
| Parameters (in) | Channel | Channel |
| Parameters (inout) | None | |
| Parameters (out) | None | |
| Return value | None | |
| Description | Notification that the network management has entered Network Mode. | |
| Available via | ComM_Nm.h | |

⌋

### 8.4.1.3 ComM_Nm_PrepareBusSleepMode

**[SWS_ComM_00391] Definition of callback function ComM_Nm_PrepareBus SleepMode** ⌈

| Service Name | ComM_Nm_PrepareBusSleepMode | |
|---|---|---|
| Syntax | `void ComM_Nm_PrepareBusSleepMode (`<br>  `NetworkHandleType Channel`<br>`)` | |
| Service ID [hex] | 0x19 | |
| Sync/Async | Asynchronous | |
| Reentrancy | Reentrant | |
| Parameters (in) | Channel | Channel |
| Parameters (inout) | None | |
| Parameters (out) | None | |
| Return value | None | |
| Description | Notification that the network management has entered Prepare Bus-Sleep Mode. Reentrancy: Reentrant (but not for the same NM-Channel) | |
| Available via | ComM_Nm.h | |

⌋

### 8.4.1.4 ComM_Nm_BusSleepMode

**[SWS_ComM_00392] Definition of callback function ComM_Nm_BusSleepMode** ⌈

| Service Name | ComM_Nm_BusSleepMode | |
|---|---|---|
| Syntax | `void ComM_Nm_BusSleepMode (`<br>  `NetworkHandleType Channel`<br>`)` | |
| Service ID [hex] | 0x1a | |
| Sync/Async | Asynchronous | |
| Reentrancy | Reentrant | |
| Parameters (in) | Channel | Channel |
| Parameters (inout) | None | |
| Parameters (out) | None | |
| Return value | None | |
| Description | Notification that the network management has entered Bus-Sleep Mode. This callback function should perform a transition of the hardware and transceiver to bus-sleep mode. | |
| Available via | ComM_Nm.h | |

⌋

### 8.4.1.5 ComM_Nm_RestartIndication

**[SWS_ComM_00792] Definition of callback function ComM_Nm_RestartIndication** ⌈

| Service Name | ComM_Nm_RestartIndication | |
|---|---|---|
| Syntax | `void ComM_Nm_RestartIndication (`<br>` NetworkHandleType Channel`<br>`)` | |
| Service ID [hex] | 0x1b | |
| Sync/Async | Asynchronous | |
| Reentrancy | Reentrant | |
| Parameters (in) | Channel | Channel |
| Parameters (inout) | None | |
| Parameters (out) | None | |
| Return value | None | |
| Description | If NmIf has started to shut down the coordinated busses, AND not all coordinated busses have indicated bus sleep state, AND on at least on one of the coordinated busses NM is restarted, THEN the NM Interface shall call the callback function ComM_Nm_RestartIndication with the nmNetworkHandle of the channels which have already indicated bus sleep state. | |
| Available via | ComM_Nm.h | |

⌋

### 8.4.1.6 ComM_Nm_RepeatMessageLeftIndication

**[SWS_ComM_91024] Definition of API function ComM_Nm_RepeatMessageLeft Indication**

*Upstream requirements:* SRS_ModeMgm_09265

⌈

| Service Name | ComM_Nm_RepeatMessageLeftIndication | |
|---|---|---|
| Syntax | `void ComM_Nm_RepeatMessageLeftIndication (`<br>` NetworkHandleType Channel`<br>`)` | |
| Service ID [hex] | 0x66 | |
| Sync/Async | Asynchronous | |
| Reentrancy | Reentrant | |
| Parameters (in) | Channel | See NetworkHandleType |
| Parameters (inout) | None | |
| Parameters (out) | None | |
| Return value | None | |
| Description | Notification that the state of all <Bus>Nm has left RepeatMessage. This interface is used to indicate by the optional Dynamic PNC-to-channel-mapping feature to indicate that learning phase ends. | |

▽

△

| Available via | ComM_Nm.h |
|---|---|

⌋

### 8.4.1.7 ComM_Nm_PncLearningBitIndication

**[SWS_ComM_91026] Definition of API function ComM_Nm_PncLearningBitIndication**

*Upstream requirements:* SRS_ModeMgm_09261

⌈

| Service Name | ComM_Nm_PncLearningBitIndication |
|---|---|
| Syntax | `void ComM_Nm_PncLearningBitIndication (`<br>`  NetworkHandleType Channel`<br>`)` |
| Service ID [hex] | 0x69 |
| Sync/Async | Asynchronous |
| Reentrancy | Reentrant |
| Parameters (in) | Channel | See NetworkHandleType |
| Parameters (inout) | None |
| Parameters (out) | None |
| Return value | None |
| Description | Service to indicate that an NM message with set PNC Learning Bit has been received. |
| Available via | ComM_Nm.h |

⌋

### 8.4.1.8 ComM_Nm_ForwardSynchronizedPncShutdown

**[SWS_ComM_91030] Definition of callback function ComM_Nm_ForwardSynchronizedPncShutdown**

*Upstream requirements:* SRS_ModeMgm_09269

⌈

| Service Name | ComM_Nm_ForwardSynchronizedPncShutdown |
|---|---|
| Syntax | `void ComM_Nm_ForwardSynchronizedPncShutdown (`<br>`  NetworkHandleType Channel,`<br>`  const uint8* PncBitVectorPtr`<br>`)` |

▽

$\triangle$

| Service ID [hex] | 0x6b | |
|---|---|---|
| Sync/Async | Synchronous | |
| Reentrancy | Reentrant | |
| Parameters (in) | Channel | Channel |
| | PncBitVectorPtr | Pointer to PNC Bit vector with all PNC bits set to "1" which are indicated for a synchronized PNC shutdown |
| Parameters (inout) | None | |
| Parameters (out) | None | |
| Return value | None | |
| Description | If an ECU in role of an intermediate PNC coordinator receives a PN shutdown message via a <Bus>Nm, then ComM is immediately indicated via ComM_Nm_ForwardSynchronizedPnc Shutdown to forward the request for a synchronized PNC shutdown of the affected PNCs given by PncBitVectorPtr. Therefore, ComM will immediately release the affected PNC state machines and forward the PNC bit vector to the affected ComM Channels and the corresponding NM channels, respectively. Note: This supports a nearly synchronized PNC shutdown across the PN topology from the top-level PNC coordinator down to the subordinated PNC node. | |
| Available via | ComM_Nm.h | |

### 8.4.1.9 ComM_Nm_UpdateEIRA

## [SWS_ComM_91028] Definition of callback function ComM_Nm_UpdateEIRA

*Upstream requirements:* SRS_ModeMgm_09248, SRS_ModeMgm_09250

| Service Name | ComM_Nm_UpdateEIRA | |
|---|---|---|
| Syntax | ```void ComM_Nm_UpdateEIRA (    const uint8* PncBitVectorPtr )``` | |
| Service ID [hex] | 0x6c | |
| Sync/Async | Synchronous | |
| Reentrancy | Reentrant | |
| Parameters (in) | PncBitVectorPtr | Pointer to the PNC bit vector which contain the current aggregated internal and external PNC requests (EIRA) |
| Parameters (inout) | None | |
| Parameters (out) | None | |
| Return value | None | |
| Description | Function to indicate the current aggregated external / internal PNC request called by Nm. | |
| Available via | ComM_Nm.h | |

### 8.4.1.10 ComM_Nm_UpdateERA

**[SWS_ComM_91029] Definition of callback function ComM_Nm_UpdateERA**

*Upstream requirements:* SRS_ModeMgm_09248, SRS_ModeMgm_09250

⌈

| Service Name | ComM_Nm_UpdateERA | |
|---|---|---|
| Syntax | `void ComM_Nm_UpdateERA (`<br>`  NetworkHandleType Channel,`<br>`  const uint8* PncBitVectorPtr`<br>`)` | |
| Service ID [hex] | 0x6d | |
| Sync/Async | Synchronous | |
| Reentrancy | Reentrant | |
| Parameters (in) | Channel | Channel |
| | PncBitVectorPtr | PNC bit vector which contain the current external PNC requests (ERA) received on the given channel |
| Parameters (inout) | None | |
| Parameters (out) | None | |
| Return value | None | |
| Description | Function to indicate the current external PNC request per channel called by Nm. | |
| Available via | ComM_Nm.h | |

⌋

## 8.4.2 AUTOSAR Diagnostic Communication Manager Interface

### 8.4.2.1 ComM_DCM_ActiveDiagnostic

**[SWS_ComM_00873]  Definition  of  callback  function  ComM_DCM_ActiveDiagnostic** ⌈

| Service Name | ComM_DCM_ActiveDiagnostic | |
|---|---|---|
| Syntax | `void ComM_DCM_ActiveDiagnostic (`<br>`  NetworkHandleType Channel`<br>`)` | |
| Service ID [hex] | 0x1f | |
| Sync/Async | Synchronous | |
| Reentrancy | Reentrant | |
| Parameters (in) | Channel | Channel needed for Diagnostic communication |
| Parameters (inout) | None | |
| Parameters (out) | None | |
| Return value | None | |
| Description | Indication of active diagnostic by the DCM. | |

▽

$\triangle$

| Available via | ComM_Dcm.h |
|---|---|

$\lfloor$

### 8.4.2.2 ComM_DCM_InactiveDiagnostic

**[SWS_ComM_00874] Definition of callback function ComM_DCM_InactiveDiagnostic** $\lceil$

| Service Name | ComM_DCM_InactiveDiagnostic | |
|---|---|---|
| Syntax | `void ComM_DCM_InactiveDiagnostic (`<br>`  NetworkHandleType Channel`<br>`)` | |
| Service ID [hex] | 0x20 | |
| Sync/Async | Synchronous | |
| Reentrancy | Reentrant | |
| Parameters (in) | Channel | Channel no longer needed for Diagnostic communication |
| Parameters (inout) | None | |
| Parameters (out) | None | |
| Return value | None | |
| Description | Indication of inactive diagnostic by the DCM. | |
| Available via | ComM_Dcm.h | |

$\lfloor$

### 8.4.3 AUTOSAR ECU State Manager Interface

### 8.4.3.1 ComM_EcuM_WakeUpIndication

**[SWS_ComM_00275] Definition of callback function ComM_EcuM_WakeUpIndication** $\lceil$

| Service Name | ComM_EcuM_WakeUpIndication | |
|---|---|---|
| Syntax | `void ComM_EcuM_WakeUpIndication (`<br>`  NetworkHandleType Channel`<br>`)` | |
| Service ID [hex] | 0x2a | |
| Sync/Async | Synchronous | |
| Reentrancy | Reentrant | |
| Parameters (in) | Channel | Channel |

$\triangledown$

$\triangle$

| Parameters (inout) | None |
|---|---|
| Parameters (out) | None |
| Return value | None |
| Description | Notification of a wake up on the corresponding channel. |
| Available via | ComM_EcuM.h |

$\rfloor$

### 8.4.3.2 ComM_EcuM_PNCWakeUpIndication

**[SWS_ComM_91001] Definition of callback function ComM_EcuM_PNCWakeUp Indication** $\lceil$

| Service Name | ComM_EcuM_PNCWakeUpIndication | |
|---|---|---|
| Syntax | `void ComM_EcuM_PNCWakeUpIndication (`<br>`  PNCHandleType PNCid`<br>`)` | |
| Service ID [hex] | 0x37 | |
| Sync/Async | Synchronous | |
| Reentrancy | Reentrant | |
| Parameters (in) | PNCid | Identifier of the partial network cluster |
| Parameters (inout) | None | |
| Parameters (out) | None | |
| Return value | None | |
| Description | Notification of a wake up on the corresponding partial network cluster. | |
| Available via | ComM_EcuM.h | |

$\rfloor$

### 8.4.4 AUTOSAR ECU State Manager and Basic Software Mode Manager Interface

#### 8.4.4.1 ComM_CommunicationAllowed

**[SWS_ComM_00871] Definition of callback function ComM_CommunicationAllowed** ⌈

| Service Name | ComM_CommunicationAllowed | |
|---|---|---|
| Syntax | `void ComM_CommunicationAllowed (`<br>`  NetworkHandleType Channel,`<br>`  boolean Allowed`<br>`)` | |
| Service ID [hex] | 0x35 | |
| Sync/Async | Asynchronous | |
| Reentrancy | Non Reentrant | |
| Parameters (in) | Channel | Channel |
| | Allowed | TRUE: Communication is allowed FALSE: Communication is not allowed |
| Parameters (inout) | None | |
| Parameters (out) | None | |
| Return value | None | |
| Description | EcuM or BswM shall indicate to ComM when communication is allowed. If EcuM/Flex is used: BswM | |
| Available via | ComM_BswM.h | |

⌋

### 8.4.5 Bus State Manager Interface

#### 8.4.5.1 ComM_BusSM_ModeIndication

**[SWS_ComM_00675] Definition of callback function ComM_BusSM_ModeIndication** ⌈

| Service Name | ComM_BusSM_ModeIndication | |
|---|---|---|
| Syntax | `void ComM_BusSM_ModeIndication (`<br>`  NetworkHandleType Channel,`<br>`  ComM_ModeType ComMode`<br>`)` | |
| Service ID [hex] | 0x33 | |
| Sync/Async | Asynchronous | |
| Reentrancy | Reentrant | |
| Parameters (in) | Channel | See NetworkHandleType |
| | ComMode | See ComM_ModeType |
| Parameters (inout) | None | |

▽

$\triangle$

| | |
|---|---|
| **Parameters (out)** | None |
| **Return value** | None |
| **Description** | Indication of the actual bus mode by the corresponding Bus State Manager. ComM shall propagate the indicated state to the users with means of the RTE and BswM. |
| **Available via** | ComM.h |

$\rfloor$

### 8.4.5.2 ComM_BusSM_BusSleepMode

**[SWS_ComM_91000]** **Definition of callback function ComM_BusSM_BusSleep Mode** $\lceil$

| | | |
|---|---|---|
| **Service Name** | ComM_BusSM_BusSleepMode | |
| **Syntax** | `void ComM_BusSM_BusSleepMode (`<br>`  NetworkHandleType Channel`<br>`)` | |
| **Service ID [hex]** | 0x34 | |
| **Sync/Async** | Synchronous | |
| **Reentrancy** | Reentrant | |
| **Parameters (in)** | Channel | Identification of the channel |
| **Parameters (inout)** | None | |
| **Parameters (out)** | None | |
| **Return value** | None | |
| **Description** | Notification of the corresponding Bus State Manager that the actual bus mode is Bus-Sleep. | |
| | Only applicable for ComM channels with ComMNmVariant set to SLAVE_ACTIVE or SLAVE_PASSIVE. | |
| | E.g. LIN slaves (ComMNMVariant = SLAVE_ACTIVE) or Ethernet channels with OA TC10 compliant Ethernet hardware which act as passive communication slave (ComMNMVariant = SLAVE_PASSIVE and EthTrcvActAsSlavePassiveEnabled set to TRUE) | |
| **Available via** | ComM.h | |

$\rfloor$

## 8.5 Scheduled functions

These functions are directly called by Basic Software Scheduler. The following functions shall have no return value and no parameter. All functions shall be non reentrant.

### 8.5.1 ComM_MainFunction

**[SWS_ComM_00429]** Definition of scheduled function ComM_MainFunction_<ComMChannel.ShortName>

*Upstream requirements:* SRS_BSW_00373

⌈

| Service Name | ComM_MainFunction_<ComMChannel.ShortName> |
|---|---|
| Syntax | ```void ComM_MainFunction_<ComMChannel.ShortName> (``` <br> ``` void``` <br> ``` )``` |
| Service ID [hex] | 0x60 |
| Description | This function shall perform the processing of the AUTOSAR ComM activities that are not directly initiated by the calls e.g. from the RTE. There shall be one dedicated Main Function for each channel of ComM. <br><br> Precondition: ComM shall be initialized |
| Available via | SchM_ComM.h |

⌋

**[SWS_ComM_00818]** ⌈Channel.ShortName shall be used to configure ComM_MainFunction_<ComMChannel.ShortName> (see section 10.2.2) .⌋

Note: ComMChannel.ShortName is the short name of the ComMChannel container

that will be managed by the ComM_MainFunction_<ComMChannel.ShortName>

function

## 8.6 Expected interfaces

In this chapter all interfaces required from other modules are shown. An overview of the required interfaces is shown in Figure 5.1.

### 8.6.1 Mandatory interfaces

This section defines all interfaces, which are required to fulfill the core functionality of the module.

**[SWS_ComM_00828] Definition of mandatory interfaces required by module ComM** ⌈

| API Function | Header File | Description |
|---|---|---|
| <Bus>SM_GetCurrentComMode | <Bus>SM.h | Function to query the actual communication mode from the <Bus> State Manager. |
| <Bus>SM_RequestComMode | <Bus>SM.h | Function to request a communication mode from the <Bus> State Manager. |
| BswM_ComM_CurrentMode | BswM_ComM.h | Function called by ComM to indicate the current communication mode of a ComM channel. |
| Dcm_ComM_FullComModeEntered | Dcm_ComM.h | This call informs the Dcm module about a ComM mode change to COMM_FULL_COMMUNICATION. |
| Dcm_ComM_NoComModeEntered | Dcm_ComM.h | This call informs the Dcm module about a ComM mode change to COMM_NO_COMMUNICATION. |
| Dcm_ComM_SilentComModeEntered | Dcm_ComM.h | This call informs the Dcm module about a ComM mode change to COMM_SILENT_ COMMUNICATION. |
| Nm_NetworkRelease | Nm.h | This function calls the <Bus>Nm_NetworkRelease bus specific function in case NmBusType is not set to NM_BUSNM_LOCALNM (e.g. CanNm_Network Release function is called if channel is configured as CAN). |
| Nm_NetworkRequest | Nm.h | This function calls the <Bus>Nm_NetworkRequest (e.g. CanNm_NetworkRequest function is called if channel is configured as CAN) function in case Nm BusType is not set to NM_BUSNM_LOCALNM. |
| Nm_PassiveStartUp | Nm.h | This function calls the <Bus>Nm_PassiveStartUp function in case NmBusType is not set to NM_ BUSNM_LOCALNM (e.g. CanNm_PassiveStartUp function is called for NM_BUSNM_CANNM). |
| NvM_GetErrorStatus | NvM.h | Service to read the block dependent error/status information. |
| NvM_ReadBlock | NvM.h | Service to copy the data of the NV block to its corresponding RAM block. |
| NvM_RestorePRAMBlockDefaults | NvM.h | Service to restore the default data to its corresponding permanent RAM block. |
| NvM_WriteBlock | NvM.h | Service to copy the data of the RAM block to its corresponding NV block. |

⌋

### 8.6.1.1 AUTOSAR NVRAM Manager module

**[SWS_ComM_00103]** ⌈The ComM module shall use the corresponding standardized services of the NVRAM Manager module (see SWS_ComM_00828) for storing and reading non-volatile configuration data ComMNoWakeup (see ECUC_ComM_00569), ComMEcuGroupClassification (see ECUC_ComM_00563), inhibition status (see SWS_ComM_00157), the Inhibit counter (see SWS_ComM_00140), the PNC-to-channel Mapping (see [SWS_ComM_01040]) and the PNC membership (see [SWS_ComM_01049]).⌋

Comment: See SWS_ComM_00864 and SWS_ComM_00865 when configuration data shall be read and stored

For details refer to the AUTOSAR NVRAM Manager module Specification [14].

### 8.6.1.2  AUTOSAR Bus State Manager

**[SWS_ComM_00962]**
   *Upstream requirements:* SRS_ModeMgm_09155

⌈The prefix for the StateManager APIs ("<Bus>SM") shall be CanSM, LinSM, FrSM, EthSM if the Parameter ComMBusType is COMM_BUS_TYPE_CAN, COMM_BUS_TYPE_LIN, COMM_BUS_TYPE_FR or COMM_BUS_TYPE_ETH accordingly.⌋

**[SWS_ComM_00957]**
   *Upstream requirements:* SRS_ModeMgm_09207

⌈If ComMBusType = "COMM_BUS_TYPE_CDD" the API prefix ("<Bus>SM") shall be configured in the Parameter "ComMCDDBusPrefix".⌋

**[SWS_ComM_00963]** ⌈The Communication Manager module shall use <Bus>SM_GetCurrentComMode() from the State Manager to query the current communication mode if necessary.⌋

**[SWS_ComM_00958]** ⌈The Communication Manager module shall use <BusSm>_RequestComMode() from the State Manager to request a dedicated communication mode.⌋

When it is necessary to request a dedicated communication mode depends on the current status of each instance of the channel state machine (see above).

For details of the functionality of the Bus State Manager modules refer to their Specification [15], [16], [17], [18].

Comment: Those APIs can be called re-entrant, as long as different channel & controller numbers are used.

### 8.6.1.3 AUTOSAR Network Management Interface

**[SWS_ComM_00261]**

*Upstream requirements:* SRS_ModeMgm_00049

⌈The ComM module shall use the corresponding functions to synchronize the bus start-up and shutdown of the Network Management (see SWS_ComM_00828).

For details refer to the AUTOSAR NM Interface Specification [19].⌋

### 8.6.1.4 AUTOSAR Diagnostic Communication Manager Module

**[SWS_ComM_00266]** ⌈The ComM module shall use the corresponding functions provided by DCM (see SWS_ComM_00828) to control the communication capabilities of the DCM module.⌋

Comment: DCM provides no functions to start/stop transmission and reception. DCM ensures to control communication according the indicated Communication Manager Module states.

For details refer to the AUTOSAR DCM Specification [20].

### 8.6.1.5 AUTOSAR RTE interface provided by RTE to ComM for the SW-C

**[SWS_ComM_00091]**

*Upstream requirements:* SRS_ModeMgm_09085

⌈The ComM module shall use the corresponding function provided by RTE to indicate modes to the users. There shall be one indication per user. Fan-out in case of a mode indication related to more than one user shall be done by the Communication Manager Module.⌋

**[SWS_ComM_00663]**

*Upstream requirements:* SRS_ModeMgm_09085

⌈If more than one channel is linked to one user request and the modes of the channels are different, the ComM module shall indicate the lowest mode to the user.⌋

**[SWS_ComM_00662]**

*Upstream requirements:* SRS_ModeMgm_09090

⌈The sequence of users shall start with user 0 up to user N and the name of the mode ports shall be UM000, UM001, ... UM<N>.⌋

Rationale for SWS_ComM_00662: It shall be possible to use the port based API also to address specific users directly.

Comment: Within the array of ports, the ports are named alphabetically.

**[SWS_ComM_00778]**

*Upstream requirements:* SRS_ModeMgm_09085

⌈The ComM module shall explicitly indicate changes in modes to each individual user, to which a SW-C is connected. The ComM module shall do this by calling the right API on the RTE through the ports "UMnnn".⌋

Comment: There is one such port per configured user to which a SW-C is connected. For users not used by SW-Cs (e.g. the users created due to ECUC_ComM_00840) no mode port will be created.

Implementation Hint: An implementation of the ComM module could use any of the normal RTE-mechanisms to signal changes in the mode to the users. Given the specific configurability of the Communication Manager Module, using the RTE "Indirect API" seems most appropriate. This works as follows (consult the RTE specification for details).

An implementation of the Communication Manager Module can use the "Rte_Ports" API to obtain an array of the "UMnnn" ports at run-time:

/* Return an array of all ports that provide the interface ComM_CurrentMode. Because of the specific naming conventions chosen, the element n in this array of ports will reference to the port UM<nnn>. For example userModePorts[1] will be a handle on port UM001 */

userModePorts = Rte_Ports_ComM_CurrentMode_P();

The number of such userModePorts can be obtained through the call Rte_NPorts_ ComM_CurrentMode_P(). This value corresponds to the size of the COMM_USER_ LIST array.

To signal that a user n is in a new mode, the Communication Manager Module should: userModePorts[n].Switch_currentMode(newMode)

For details refer to the AUTOSAR RTE specification [7] and AUTOSAR Services Mode Management specification [11].

### 8.6.1.6   Basic Software Mode Manager (BswM)

### [SWS_ComM_00861]

*Upstream requirements:* SRS_ModeMgm_09251

⌈The ComM module shall use the corresponding function provided by BswM to report the states of Communication Manager Module channels (see SWS_ComM_00828).⌋

For details refer to AUTOSAR Basic Software Mode Manager module [21].

### 8.6.2   Optional interfaces

This section defines all interfaces, which are required to fulfill an optional functionality of the module.

### [SWS_ComM_00829] Definition of optional interfaces requested by module ComM ⌈

| API Function | Header File | Description |
|---|---|---|
| BswM_ComM_CurrentPNCMode | BswM_ComM.h | Function is called by ComM to indicate the current mode of the PNC. |
| BswM_ComM_InitiateReset | BswM_ComM.h | Function is called by ComM to signal a shutdown. |
| Det_ReportError | Det.h | Service to report development errors. |
| Det_ReportRuntimeError | Det.h | Service to report runtime errors. If a callout has been configured then this callout shall be called. |
| Nm_PnLearningRequest | Nm.h | Set Repeat Message Request Bit and Partial Network Learning Bit for NM messages transmitted next on the bus. For that purpose <Bus>Nm_Pn LearningRequest shall be called (e.g. CanNm_Pn LearningRequest function if channel is configured as CAN). This will force all nodes to enter the PNC Learning Phase and re-enter Repeat Message Stat. This is needed for the optional Dynamic PNC-to-channel-mapping feature. |
| Nm_RequestSynchronizedPnc Shutdown | Nm.h | This function store the request for a synchronized PNC shutdown of a particular PNC given by PncId per given NM-Channel. The handling of the synchronized PNC shutdown process is mainly done in the context of the Nm_Mainfunction.<br><br>The function call is only valid if NmStandardBusType is not set to NM_BUSNM_LOCALNM as a <Bus>Nm like CanNm is needed to transmit the PNC shutdown requests. |
| Nm_UpdateIRA | Nm.h | Indication by ComM of internal PNC requests. This is used to aggregate the internal PNC requests. |

⌋

### 8.6.3 Configurable interfaces

None.

## 8.7 Service Interfaces

### 8.7.1 Sender-Receiver-Interfaces

#### 8.7.1.1 ComM_CurrentChannelRequest

**[SWS_ComM_00904] Definition of SenderReceiverInterface ComM_Current ChannelRequest_{channel_name}** ⌈

| Name | ComM_CurrentChannelRequest_{channel_name} | |
|---|---|---|
| **Comment** | Array of ComMUserIdentifier, that currently hold FULL_COM requests for this channel. The size of the attribute fullComRequestors.handleArray is NUM_COMM_USER_PER_CHANNEL | |
| **IsService** | true | |
| **Variation** | {ecuc(ComM/ComMConfigSet/ComMChannel/ComMFullCommRequestNotificationEnabled)} == true<br>channel_name = {ecuc(ComM/ComMConfigSet/ComMChannel.SHORT-NAME)} | |
| **Data Elements** | fullComRequestors | |
| | **Type** | ComM_UserHandleArrayType_{channel_name} |
| | **Variation** | channel_name = {ecuc(ComM/ComMConfigSet/ComMChannel.SHORT-NAME)} |

⌋

### 8.7.2 Client-Server-Interfaces

#### 8.7.2.1 ComM_ChannelLimitation

**[SWS_ComM_00743] Definition of ClientServerInterface ComM_ChannelLimitation** ⌈

| Name | ComM_ChannelLimitation | | |
|---|---|---|---|
| **Comment** | A SW-C playing the role of a "Mode Manager" can use this interface to configure the Communication Manager Module to inhibit communication mode for a given channel. | | |
| **IsService** | true | | |
| **Variation** | {ecuc(ComM/ComMGeneral.ComMModeLimitationEnabled)} == true | | |
| **Possible Errors** | 0 | E_OK | Operation successful |
| | 1 | E_NOT_OK | Operation failed |

| Operation | GetInhibitionStatus | |
|---|---|---|
| **Comment** | returns the inhibition status of a channel | |
| **Mapped to API** | ComM_GetInhibitionStatus | |
| **Variation** | – | |
| **Parameters** | Status | |
| | **Type** | ComM_InhibitionStatusType |
| | **Direction** | OUT |
| | **Comment** | – |
| | **Variation** | – |
| **Possible Errors** | E_OK<br>E_NOT_OK | |

| Operation | LimitChannelToNoComMode | |
|---|---|---|
| **Comment** | Changes the inhibition status for the channel for changing from COMM_NO_ COMMUNICATION to a higher Communication Mode.<br><br>(See also ComM_LimitECUToNoComMode, same functionality but for all channels) | |
| **Mapped to API** | ComM_LimitChannelToNoComMode | |
| **Variation** | – | |
| **Parameters** | Status | |
| | **Type** | boolean |
| | **Direction** | IN |
| | **Comment** | FALSE: Limit channel to COMM_NO_COMMUNICATION disabled<br>TRUE: Limit channel to COMM_NO_COMMUNICATION enabled |
| | **Variation** | – |
| **Possible Errors** | E_OK<br>E_NOT_OK | |

⌋

## 8.7.2.2   ComM_ChannelWakeup

**[SWS_ComM_00742] Definition of ClientServerInterface ComM_ChannelWakeup**
⌈

| Name | ComM_ChannelWakeup | | |
|---|---|---|---|
| **Comment** | A SW-C playing the role of a "Mode Manager" can use this interface to configure the Communication Manager Module to take precautions against awakening other ECU's by starting the communication. | | |
| **IsService** | true | | |
| **Variation** | {ecuc(ComM/ComMGeneral.ComMWakeupInhibitionEnabled)} == true | | |
| **Possible Errors** | 0 | E_OK | Operation successful |
| | 1 | E_NOT_OK | Operation failed |

| Operation | GetInhibitionStatus | |
|---|---|---|
| **Comment** | returns the inhibition status of a channel | |
| **Mapped to API** | ComM_GetInhibitionStatus | |
| **Variation** | – | |
| **Parameters** | Status | |
| | **Type** | ComM_InhibitionStatusType |
| | **Direction** | OUT |
| | **Comment** | – |
| | **Variation** | – |
| **Possible Errors** | E_OK<br>E_NOT_OK | |

| Operation | PreventWakeUp | |
|---|---|---|
| **Comment** | Changes the inhibition status COMM_NO_WAKEUP for the corresponding channel. | |
| **Mapped to API** | ComM_PreventWakeUp | |
| **Variation** | – | |
| **Parameters** | Status | |
| | **Type** | boolean |
| | **Direction** | IN |
| | **Comment** | – |
| | **Variation** | – |
| **Possible Errors** | E_OK<br>E_NOT_OK | |

⌋

### 8.7.2.3 ComM_ECUModeLimitation

**[SWS_ComM_00741] Definition of ClientServerInterface ComM_ECUModeLimitation** ⌈

| Name | ComM_ECUModeLimitation | | |
|---|---|---|---|
| **Comment** | A SW-C which plays the role of a "Mode Manager" can use this interface to change the behavior of the entire ECU. | | |
| **IsService** | true | | |
| **Variation** | {ecuc(ComM/ComMGeneral.ComMModeLimitationEnabled)} == true | | |
| **Possible Errors** | 0 | E_OK | Operation successful |
| | 1 | E_NOT_OK | Operation failed |

| Operation | LimitECUToNoComMode |
|---|---|
| **Comment** | Changes the inhibition status for the ECU (=all channels) for changing from COMM_NO_COMMUNICATION to a higher Communication Mode.<br><br>(See also ComM_LimitChannelToNoComMode, same functionality but for a specific channels) |
| **Mapped to API** | ComM_LimitECUToNoComMode |

▽

$\triangle$

| Variation | – | |
|---|---|---|
| **Parameters** | Status | |
| | **Type** | boolean |
| | **Direction** | IN |
| | **Comment** | FALSE: Limit ECU to COMM_NO_COMMUNICATION disabled<br>TRUE: Limit ECU to COMM_NO_COMMUNICATION enabled |
| | **Variation** | – |
| **Possible Errors** | E_OK<br>E_NOT_OK | |

| Operation | ReadInhibitCounter | |
|---|---|---|
| **Comment** | returns the value of the 'inhibited full communication request counter' | |
| **Mapped to API** | ComM_ReadInhibitCounter | |
| **Variation** | {ecuc(ComM/ComMGeneral.ComMGlobalNvMBlockDescriptor)} != NULL | |
| **Parameters** | CounterValue | |
| | **Type** | uint16 |
| | **Direction** | OUT |
| | **Comment** | – |
| | **Variation** | – |
| **Possible Errors** | E_OK<br>E_NOT_OK | |

| Operation | ResetInhibitCounter |
|---|---|
| **Comment** | reset the "inhibited full communication request counter" |
| **Mapped to API** | ComM_ResetInhibitCounter |
| **Variation** | {ecuc(ComM/ComMGeneral.ComMGlobalNvMBlockDescriptor)} != NULL |
| **Possible Errors** | E_OK<br>E_NOT_OK |

| Operation | SetECUGroupClassification | |
|---|---|---|
| **Comment** | changes the ECU group classification status | |
| **Mapped to API** | ComM_SetECUGroupClassification | |
| **Variation** | – | |
| **Parameters** | Status | |
| | **Type** | ComM_InhibitionStatusType |
| | **Direction** | IN |
| | **Comment** | – |
| | **Variation** | – |
| **Possible Errors** | E_OK<br>E_NOT_OK | |

$\rfloor$

### 8.7.2.4 ComM_UserRequest

## [SWS_ComM_01000] Definition of ClientServerInterface ComM_UserRequest $\lceil$

| Name | ComM_UserRequest |
|---|---|
| **Comment** | A SW-C that wants to explicitly direct the local Communication Manager Module of the ECU towards a certain state requires the client-server interface ComM_UserRequest. Through this interface, the SW-C could either set the desired state of all communication channels (if the user is mapped to one or more channels) or of all PNCs (if the user is mapped to one or more PNCs) that are relevant for that component to "No Communication" or "Full Communication". |
| **IsService** | true |
| **Variation** | – |

| **Possible Errors** | 0 | E_OK | Operation successful |
|---|---|---|---|
| | 1 | E_NOT_OK | Operation failed |
| | 2 | COMM_E_MODE_ LIMITATION | ComMMode cannot be granted because of Com MMode inhibition |
| | 3 | COMM_E_MULTIPLE_ PNC_ASSIGNED | Operation is not possible since multiple PNCs are assigned to the affected ComMUser |
| | 4 | COMM_E_NO_PNC_ ASSIGNED | Operation is not possible since no PNC is assigned to the affected ComMUser |

| **Operation** | GetCurrentComMode |
|---|---|
| **Comment** | Returns the current Communication Manager Module mode for the SW-C-Return the current Communication Manager Modul channel mode to the SW-C. Please note: the channel mode is returned. Even though the affected user is assigned to a PNC. (see ComM_GetCurrentCom Mode) |
| **Mapped to API** | ComM_GetCurrentComMode |
| **Variation** | – |

| **Parameters** | ComMode | |
|---|---|---|
| | **Type** | ComM_ModeType |
| | **Direction** | OUT |
| | **Comment** | – |
| | **Variation** | – |

| **Possible Errors** | E_OK E_NOT_OK |
|---|---|

| **Operation** | GetCurrentPNCComMode |
|---|---|
| **Comment** | Return the current Communication Manager Modul PNC mode to the SW-C. Please note: the PNC mode is returned as ComM_ModeType (COMM_NO_COMMUNICATION == COMM_ PNC_NO_COMMUNICATIO, COMM_FULL_COMMUNICATION == COMM_PNC_FULL_ COMMUNICATION). If the affected ComM user is mapped to multiple PNCs than the operation shall return COMM_E_MULTIPLE_PNC_ASSIGNED. If the affected ComM user is mapped to no PNC than the operation shall return COMM_E_NO_PNC_ASSIGNED. |
| **Mapped to API** | ComM_GetCurrentPNCComMode |
| **Variation** | – |

| **Parameters** | ComMode | |
|---|---|---|
| | **Type** | ComM_ModeType |
| | **Direction** | OUT |
| | **Comment** | – |
| | **Variation** | – |

| **Possible Errors** | E_OK E_NOT_OK COMM_E_MULTIPLE_PNC_ASSIGNED COMM_E_NO_PNC_ASSIGNED |
|---|---|

| Operation | GetMaxComMode | |
|---|---|---|
| Comment | Returns the current Communication Manager Module mode for the SW-C | |
| Mapped to API | ComM_GetMaxComMode | |
| Variation | – | |
| Parameters | ComMode | |
| | Type | ComM_ModeType |
| | Direction | OUT |
| | Comment | – |
| | Variation | – |
| Possible Errors | E_OK E_NOT_OK | |

| Operation | GetRequestedComMode | |
|---|---|---|
| Comment | Returns that last Communication Manager Module Mode requested by the SW-C | |
| Mapped to API | ComM_RequestComMode | |
| Variation | – | |
| Parameters | ComMode | |
| | Type | ComM_ModeType |
| | Direction | OUT |
| | Comment | – |
| | Variation | – |
| Possible Errors | E_OK E_NOT_OK | |

| Operation | RequestComMode | |
|---|---|---|
| Comment | The SW-C requests that all communication channels it needs are in the provided Communication Manager Module mode | |
| Mapped to API | ComM_GetRequestedComMode | |
| Variation | – | |
| Parameters | ComMode | |
| | Type | ComM_ModeType |
| | Direction | IN |
| | Comment | – |
| | Variation | – |
| Possible Errors | E_OK E_NOT_OK COMM_E_MODE_LIMITATION | |

⌋

### 8.7.2.5 ComM_PncToChannelMapping

**[SWS_ComM_91102] Definition of ClientServerInterface ComM_PncToChannel Mapping**

*Upstream requirements:* SRS_ModeMgm_09259

⌈

| Name | ComM_PncToChannelMapping |
|---|---|
| **Comment** | Client-server interface to get, update or clear the PNC-to-channel-mapping |
| **IsService** | true |
| **Variation** | {ecuc(ComM/ComMGeneral/ComMDynamicPncToChannelMappingSupport)} == true |
| **Possible Errors** | 0 | E_OK | Operation successful |
| | 1 | E_NOT_OK | Operation failed |
| | 5 | COMM_E_LEARNING_ ACTIVE | Operation not possible as PNC Learning Phase is active |

| Operation | GetPncToChannelMapping | | |

# 9    Sequence diagrams

## 9.1    Transmission and Reception start (CAN)

Figure 9.1 shows the sequence for starting transmission and reception on CAN. The behaviour is equal for LIN, FlexRay and Ethernet just with different API names.

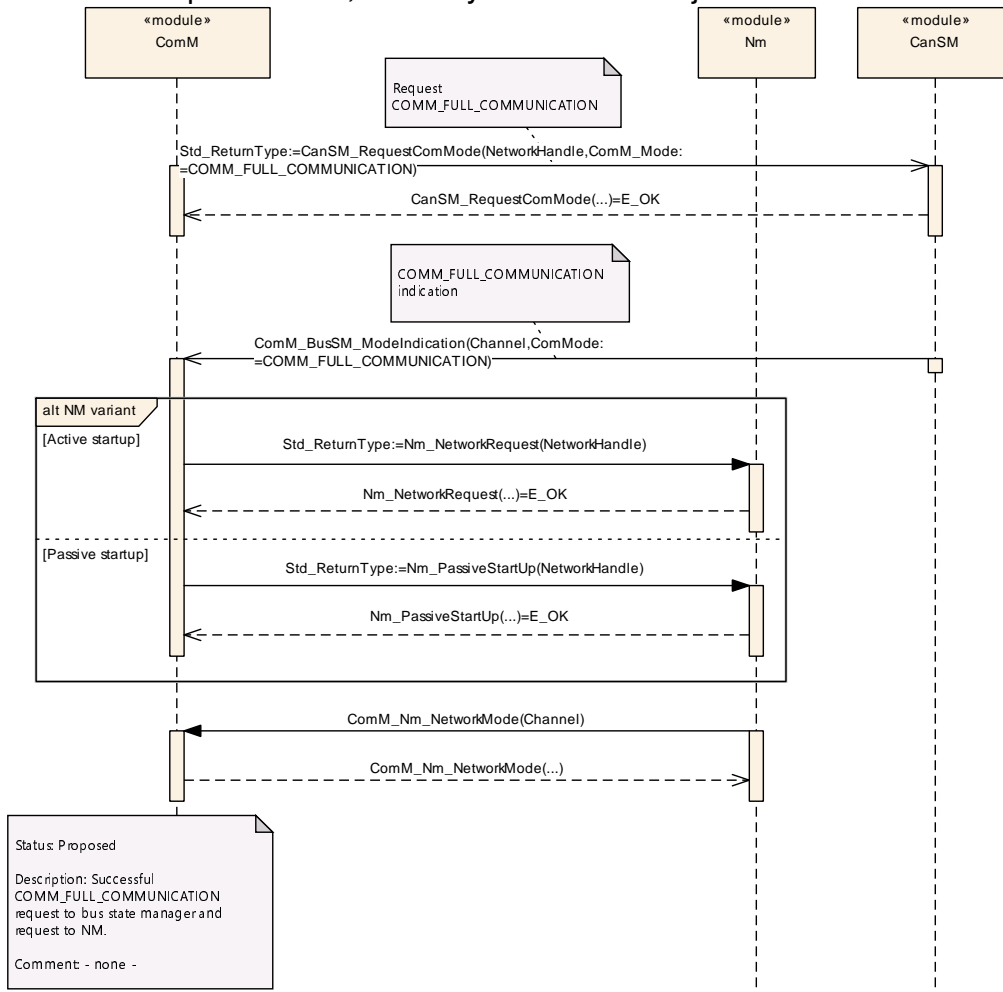

**Figure 9.1: Starting transmission and reception on CAN**

## 9.2    Passive Wake-up (CAN)

Figure 9.2 shows the behaviour after a wake-up indicated by the ECU State Manager module, or the Nm module for a CAN channel. The behaviour is equal for LIN, FlexRay and Ethernet just with different API names.
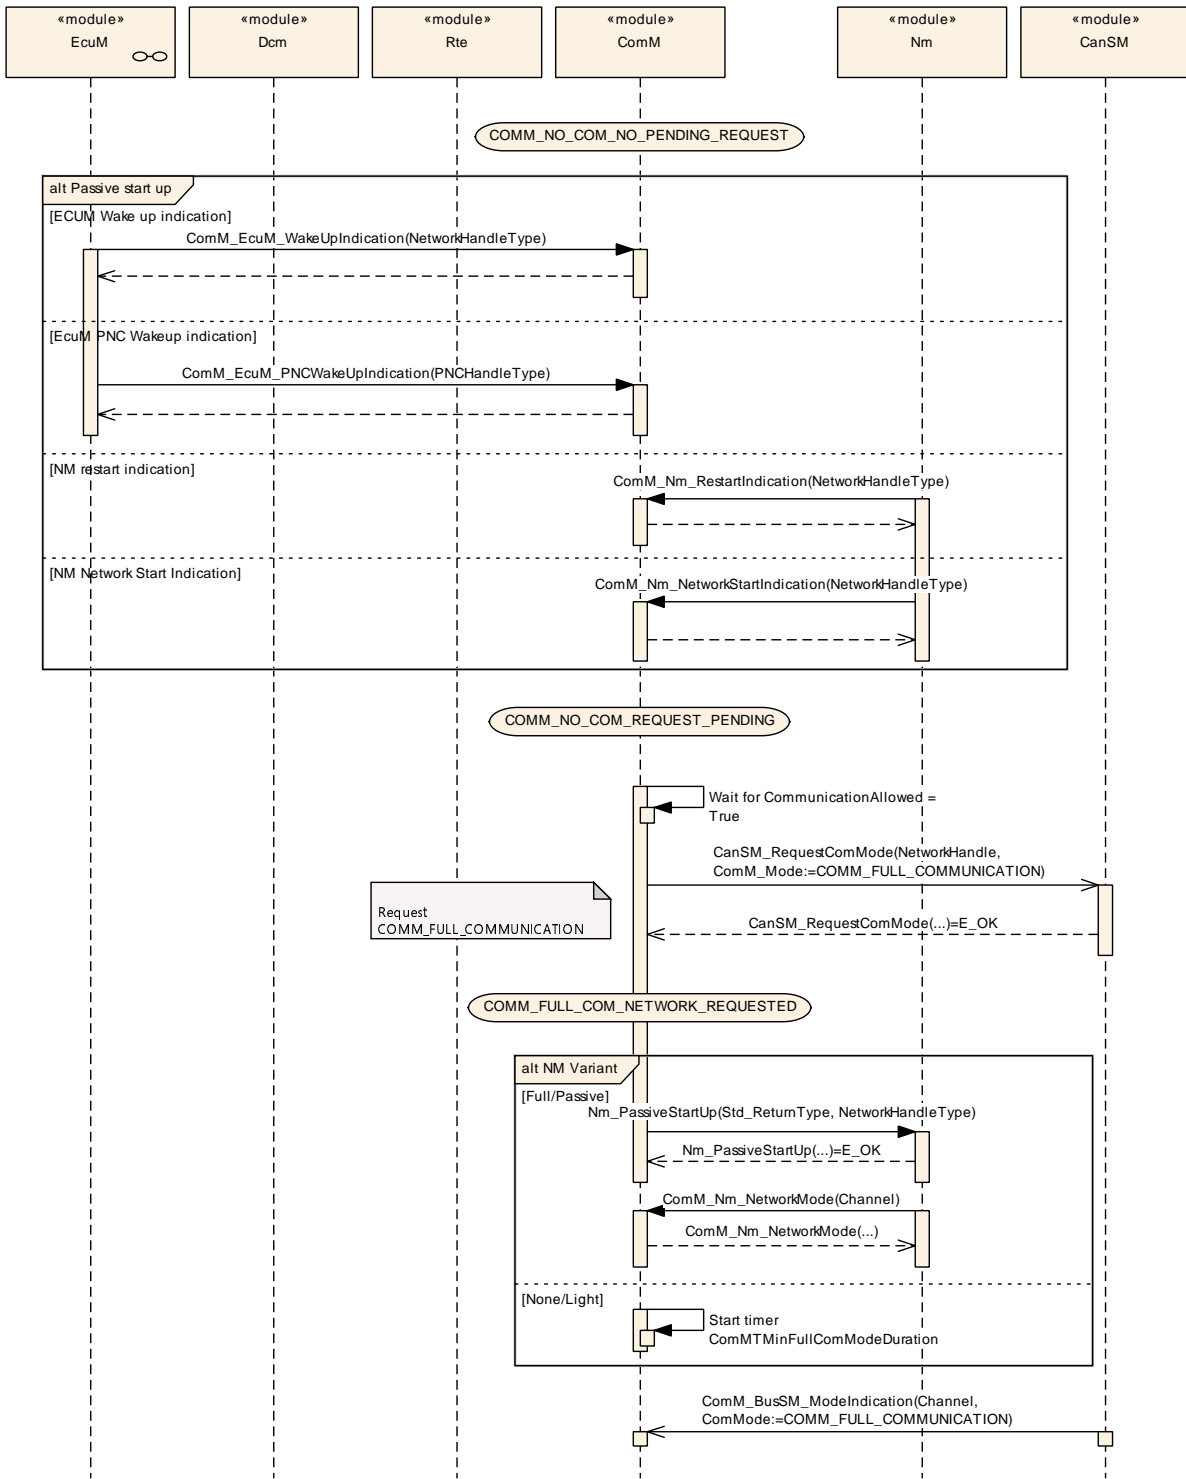

**Figure 9.2: Reaction on a wake-up indicated by the ECU State Manager module**

## 9.3  Network shutdown (CAN)

Figure 9.3 shows the possibilities to shutdown the CAN network. It can be either initiated if the last user releases his COMM_FULL_COMMUNICATION request or ComM_-
LimitChannelToNoComMode (see [SWS_ComM_00163]) is called. The behaviour is equal for LIN, FlexRay and Ethernet just with different API names.
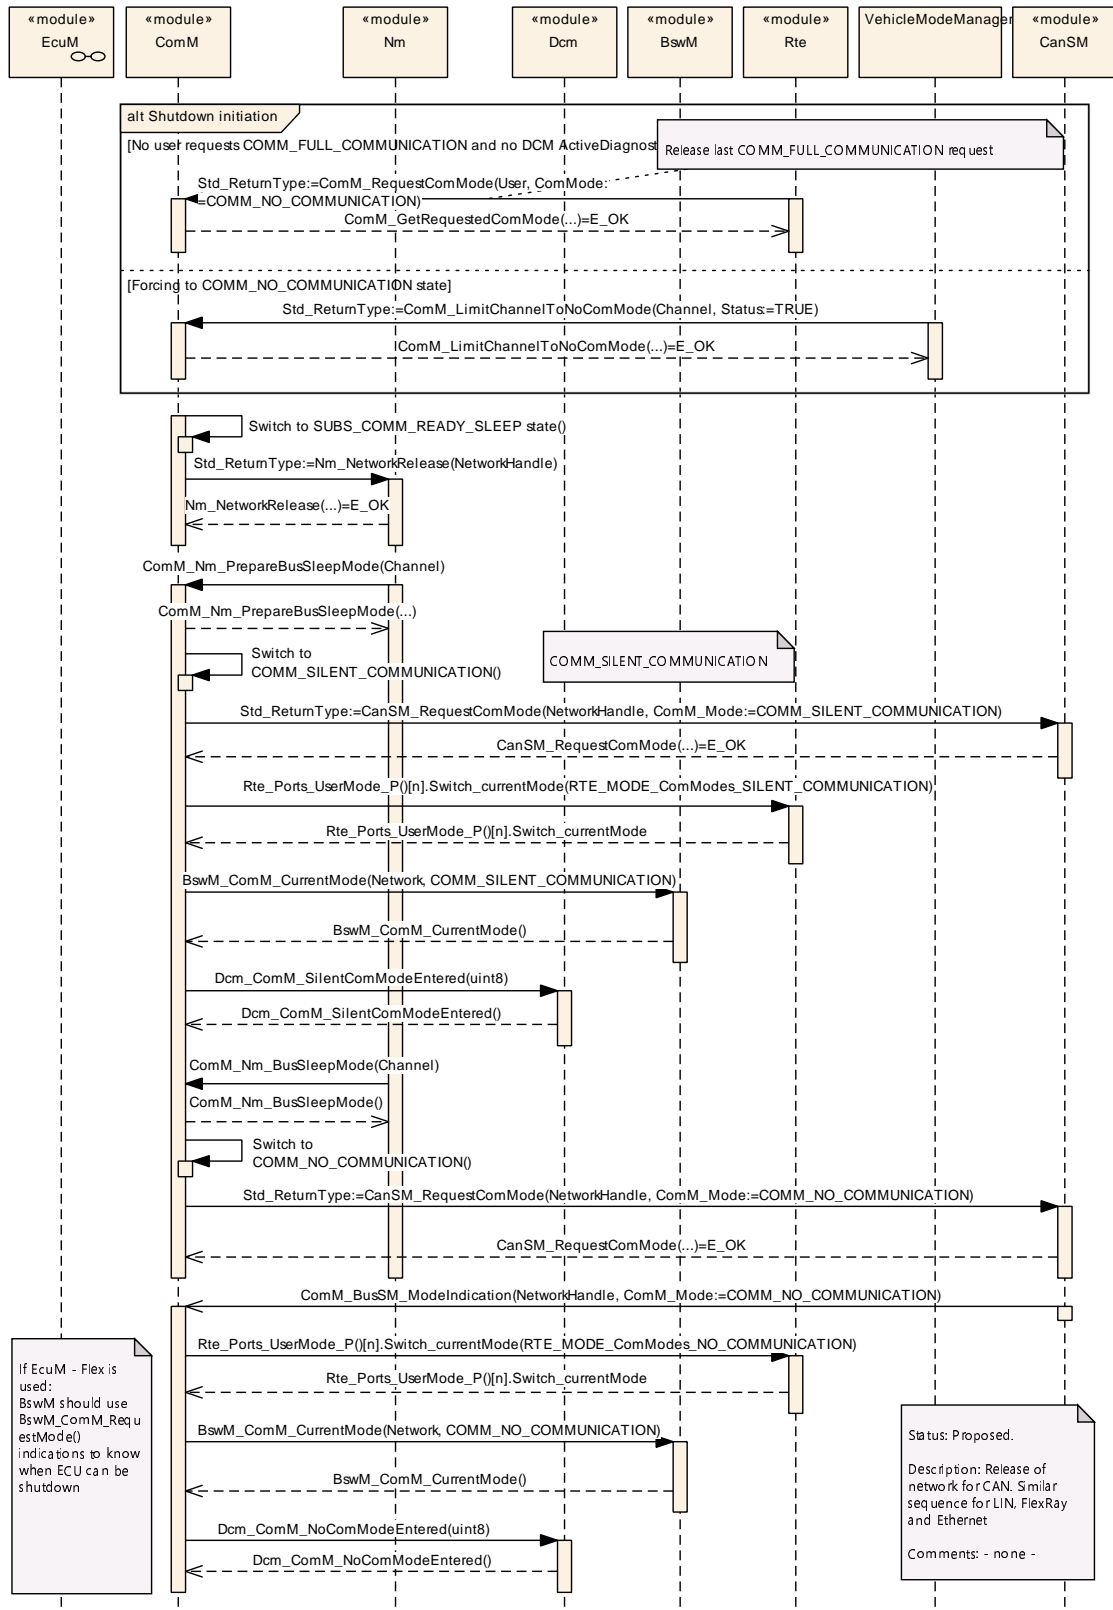

**Figure 9.3: Network shutdown (CAN)**

## 9.4 Communication request

Figure 9.4 shows the possibilities to start COMM_FULL_COMMUNICATION on CAN. It can be either initiated if a user requests COMM_FULL_COMMUNICATION request or DCM indicates ComM_DCM_ActiveDiagnostic (see [SWS_ComM_00873]). The behaviour is equal for LIN, FlexRay and Ethernet just with different API names.

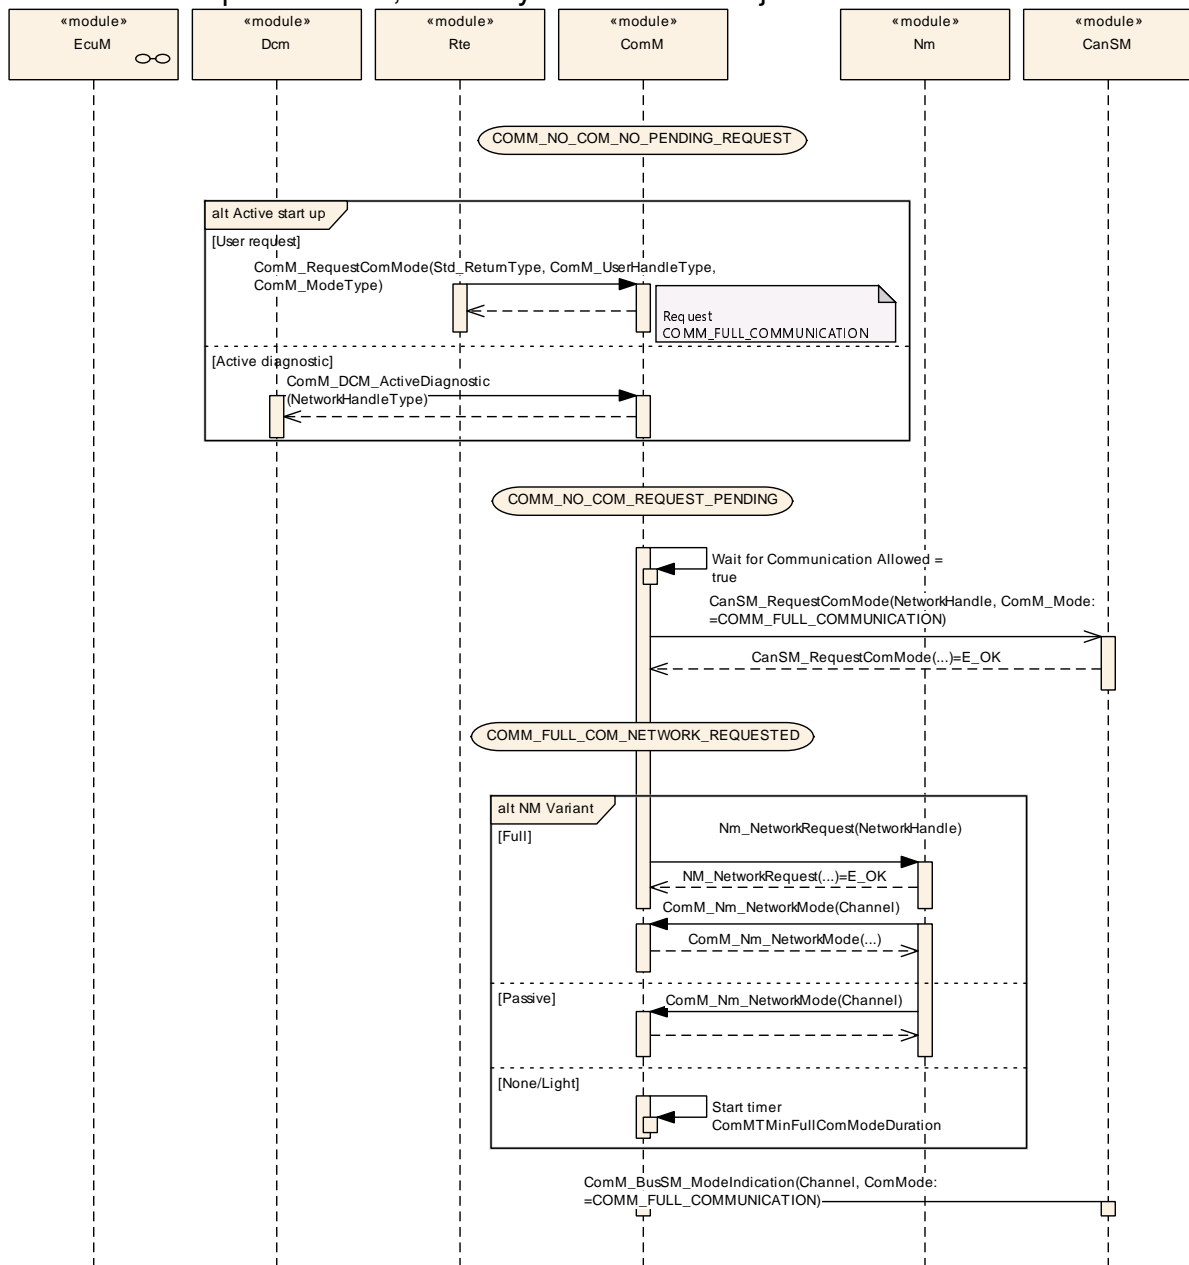

**Figure 9.4: Request Communication**

## 9.5 Synchronized PNC shutdown

Note: The sequence diagrams shows the expected behaviour, but not the implementation

Figure 9.5 shows the request for a synchronized PNC shutdown if an ECU in the role of a top-level PNC coordinator detects a release of a PNC.

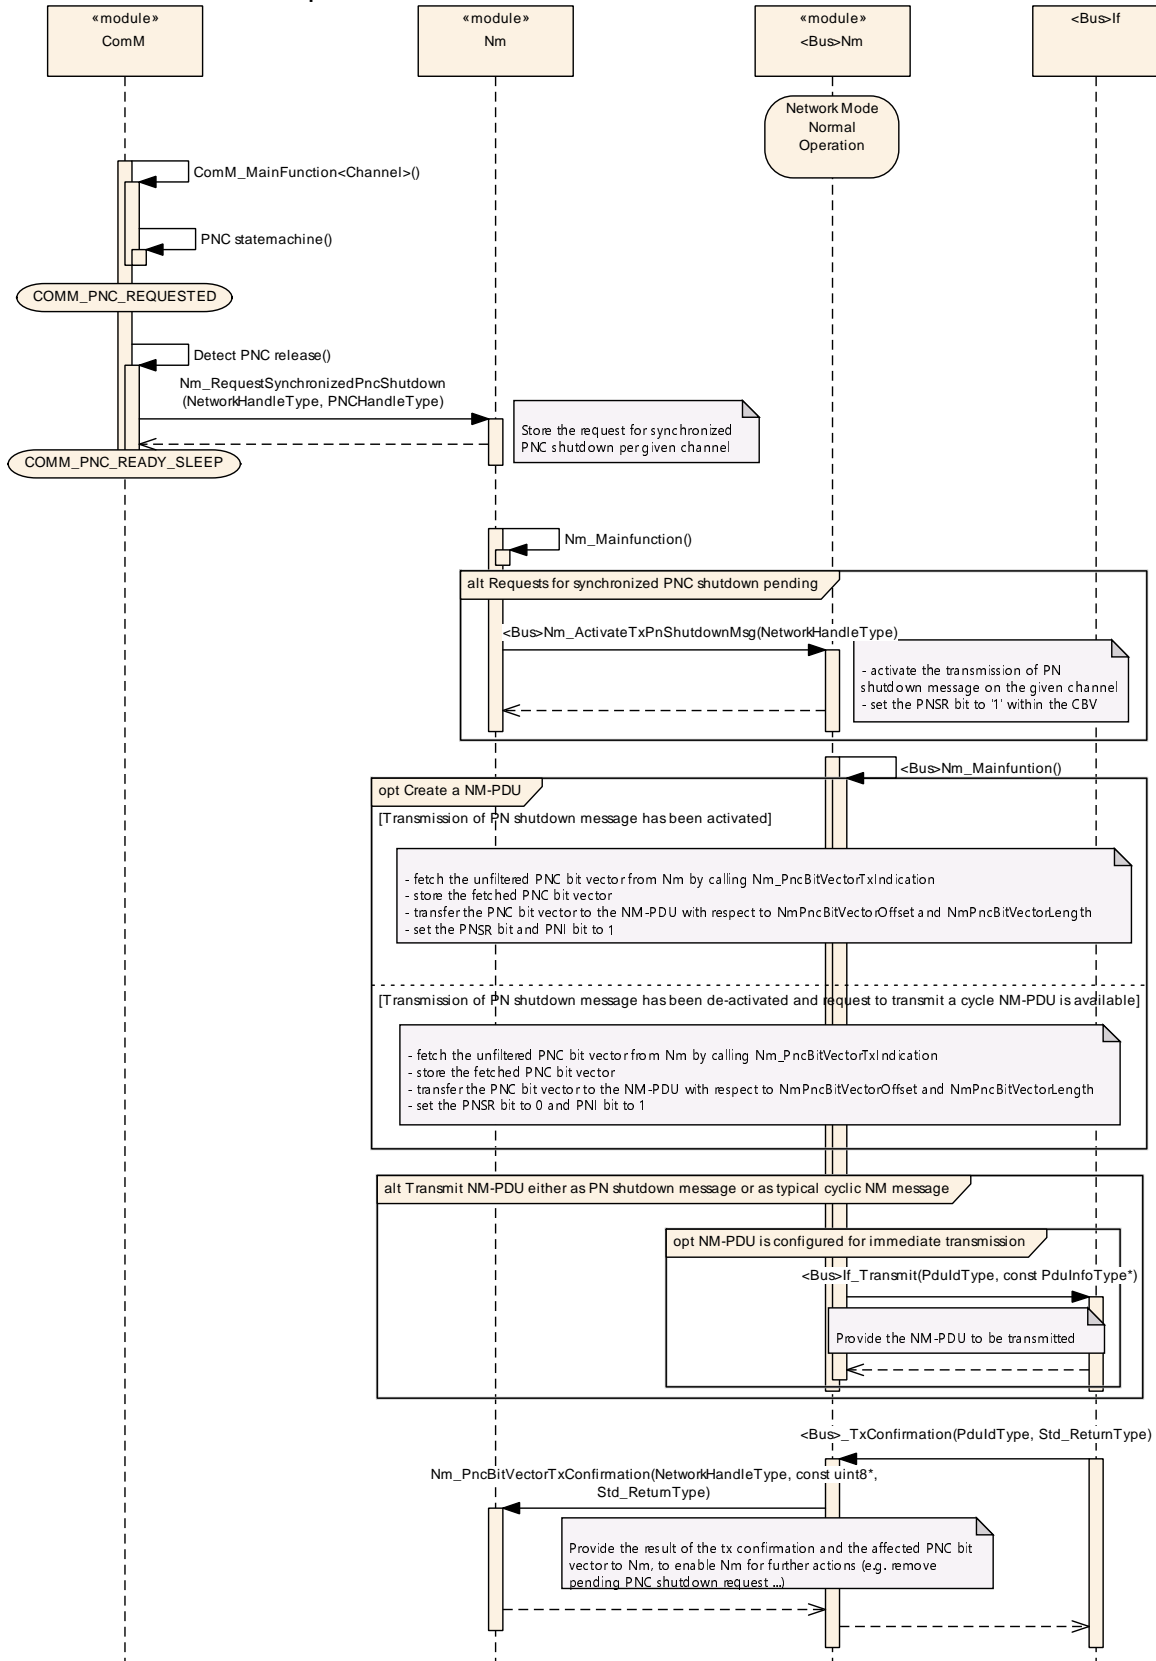

**Figure 9.5: Request for a synchronized PNC shutdown in the role of a top-level PNC coordinator (TLPC)**

Figure 9.6 and Figure 9.7 shows the request to forward a received synchronized PNC shutdown if an ECU in role of an intermediate PNC coordinator receives a PN shutdown message.

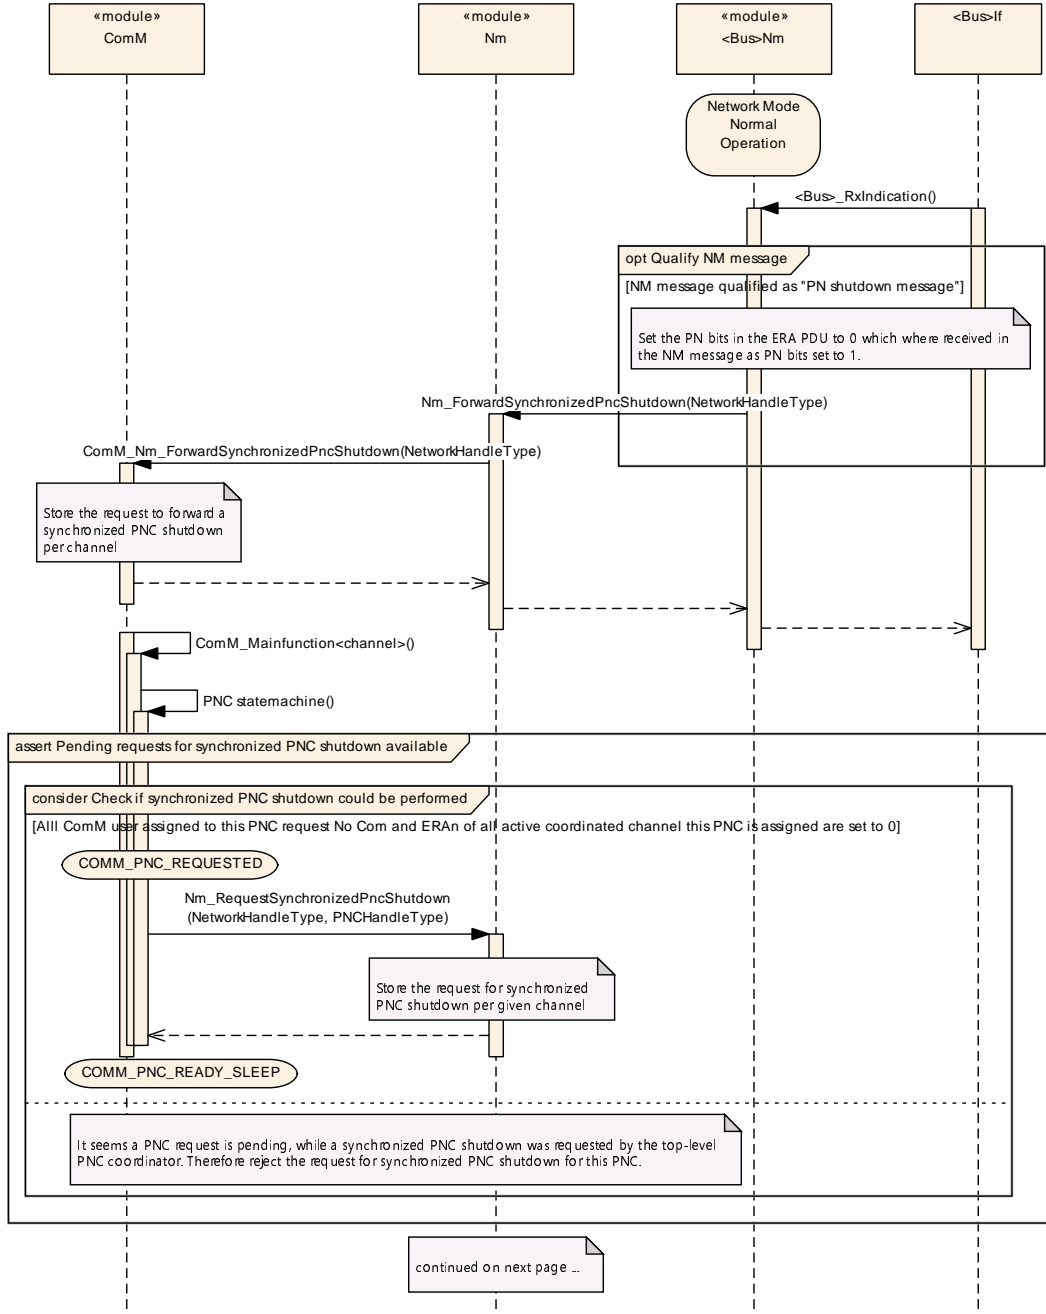

**Figure 9.6: Request to forward a synchronized PNC shutdown in the role of an intermediate PNC coordinator (part 1)**
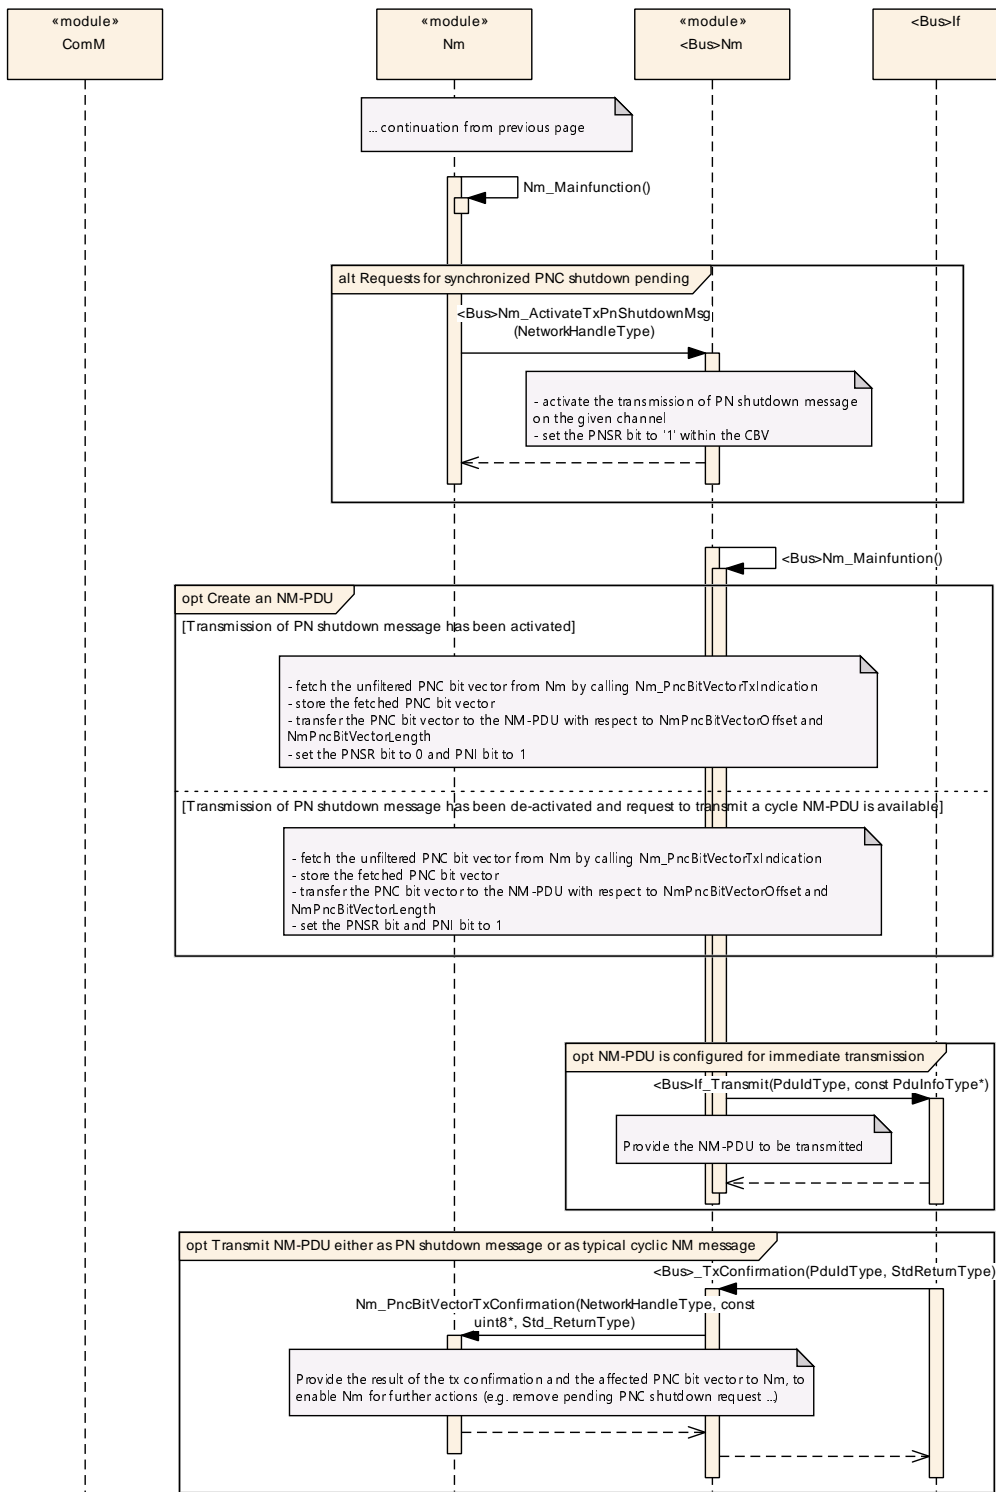

**Figure 9.7: Request to forward a synchronized PNC shutdown in the role of an interme-diate PNC coordinator (part 2)**

# 10 Configuration specification

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification Chapter 10.1 describes fundamentals.

Chapter 10.2 specifies the structure (containers) and the parameters of the module Communication Manager.

Chapter 10.3 specifies published information of the module Communication Manager.

## 10.1 How to read this chapter

For details refer to the chapter 10.1 "Introduction to configuration specification" in [6].

## 10.2 Containers and configuration parameters

The following chapters summarize all configuration parameters. The detailed meanings of the parameters describe Chapter 7 and Chapter 8.

**[SWS_ComM_00419]**

  *Upstream requirements:* SRS_BSW_00167

⌈The ComM module pre-compile time and link time configuration parameters shall be checked statically (at the latest during link time) for correctness.⌋

**[SWS_ComM_00322]**

  *Upstream requirements:* SRS_ModeMgm_09133

⌈The ComM module configuration shall support configuration of bus type for each channel.⌋

Rationale for [SWS_ComM_00322]: Interfaces for controlling the communication stack depends on the bus type.

**[SWS_ComM_00464]**

  *Upstream requirements:* SRS_BSW_00345, SRS_BSW_00159, SRS_BSW_00167

⌈The ComM module shall strictly separate configuration from implementation.⌋

Rationale for [SWS_ComM_00464]: Easy and clear configuration.

### 10.2.1   ComM

### [ECUC_ComM_00890] Definition of EcucModuleDef ComM ⌈

| Module Name | ComM |
|---|---|
| **Description** | Configuration of the ComM (Communications Manager) module. |
| **Post-Build Variant Support** | true |
| **Supported Config Variants** | VARIANT-POST-BUILD, VARIANT-PRE-COMPILE |

| Included Containers | | |
|---|---|---|
| **Container Name** | **Multiplicity** | **Scope / Dependency** |
| ComMConfigSet | 1 | This container contains the configuration parameters and sub containers of the AUTOSAR ComM module. |
| ComMGeneral | 1 | General configuration parameters of the Communication Manager. |

⌋
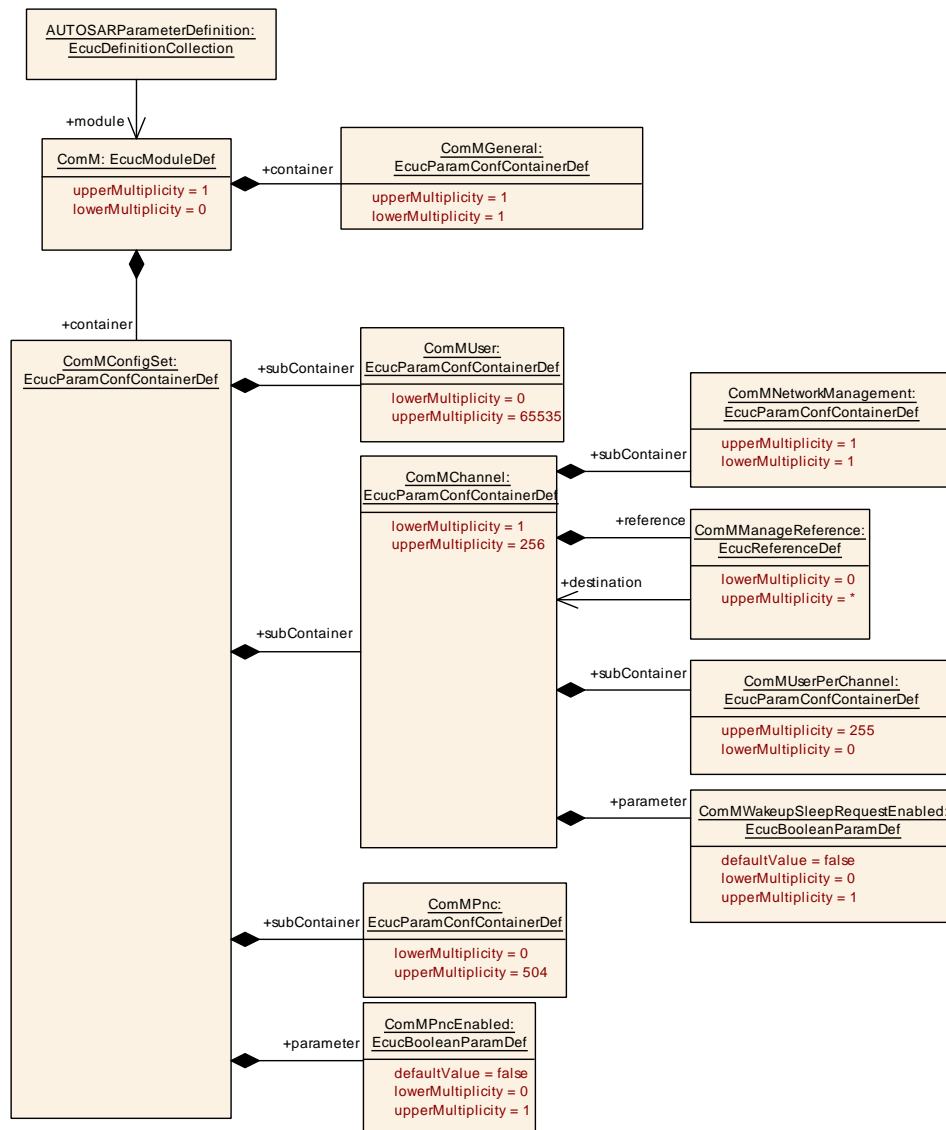

**Figure 10.1: Configuration ComM**

⌋

## [ECUC_ComM_00895] Definition of EcucBooleanParamDef ComMDynamicPnc ToChannelMappingSupport ⌈

| Parameter Name | ComMDynamicPncToChannelMappingSupport | | |
|---|---|---|---|
| Parent Container | ComMGeneral | | |
| Description | Precompile time switch to enable the dynamic PNC-to-channel-mapping handling. False: Dynamic PNC-to-channel-mapping is disabled True: Dynamic PNC-to-channel-mapping is enabled | | |
| Multiplicity | 1 | | |
| Type | EcucBooleanParamDef | | |
| Default value | false | | |
| Post-Build Variant Value | false | | |
| Value Configuration Class | Pre-compile time | X | All Variants |
| | Link time | – | |
| | Post-build time | – | |
| Scope / Dependency | scope: ECU dependency: shall only be TRUE if ComMPncSupport = TRUE | | |

⌋

## [ECUC_ComM_00563] Definition of EcucIntegerParamDef ComMEcuGroupClassification ⌈

| Parameter Name | ComMEcuGroupClassification | | |
|---|---|---|---|
| Parent Container | ComMGeneral | | |
| Description | Defines whether a mode inhibition affects the ECU or not. Examples: 000: No mode inhibition can be activated 001: Wake up inhibition can be enabled | | |
| Multiplicity | 1 | | |
| Type | EcucIntegerParamDef | | |
| Range | 0 .. 255 | | |
| Default value | 3 | | |
| Post-Build Variant Value | false | | |
| Value Configuration Class | Pre-compile time | X | All Variants |
| | Link time | – | |
| | Post-build time | – | |
| Scope / Dependency | scope: local dependency: Shall be stored non volatile (value must be kept during a reset) at least if Wake up inhibition is enabled/allowed. Can be changed during runtime with ComM_Set ECUGroupClassification() thus the default values shall be set only once (first ECU initialization). | | |

⌋

### [ECUC_ComM_00560]  Definition of EcucBooleanParamDef ComMModeLimitationEnabled ⌈

| Parameter Name | ComMModeLimitationEnabled | | |
|---|---|---|---|
| Parent Container | ComMGeneral | | |
| Description | true if mode limitation functionality shall be enabled. true: Enabled false: Disabled | | |
| Multiplicity | 1 | | |
| Type | EcucBooleanParamDef | | |
| Default value | false | | |
| Post-Build Variant Value | false | | |
| Value Configuration Class | Pre-compile time | X | All Variants |

### 10.2.3 ComMConfigSet

**[ECUC_ComM_00879] Definition of EcucParamConfContainerDef ComMConfig
Set** ⌈

| Container Name | ComMConfigSet |
|---|---|
| **Parent Container** | ComM |
| **Description** | This container contains the configuration parameters and sub containers of the AUTOSAR ComM module. |
| **Configuration Parameters** | |

| Included Parameters | | |
|---|---|---|
| **Parameter Name** | **Multiplicity** | **ECUC ID** |
| ComMPncEnabled | 0..1 | [ECUC_ComM_00878] |

| Included Containers | | |
|---|---|---|
| **Container Name** | **Multiplicity** | **Scope / Dependency** |
| ComMChannel | 1..256 | This container contains the configuration (parameters) of the bus channel(s). The channel parameters shall be harmonized within the whole communication stack. |
| ComMPnc | 0..504 | This container contains the configuration of the partial network cluster (PNC). |
| ComMUser | 0..65535 | This container contains a list of identifiers that are needed to refer to a user in the system which is designated to request Communication modes. |

⌋

## [ECUC_ComM_00878] Definition of EcucBooleanParamDef ComMPncEnabled ⌈

| Parameter Name | ComMPncEnabled | | |
|---|---|---|---|
| **Parent Container** | ComMConfigSet | | |
| **Description** | Defines whether in this configuration set the partial networking is enabled. true: Enabled false: Disabled | | |
| **Multiplicity** | 0..1 | | |
| **Type** | EcucBooleanParamDef | | |
| **Default value** | false | | |
| **Post-Build Variant Multiplicity** | true | | |
| **Post-Build Variant Value** | true | | |
| **Multiplicity Configuration Class** | Pre-compile time | X | VARIANT-PRE-COMPILE |
| | Link time | – | |
| | Post-build time | X | VARIANT-POST-BUILD |
| **Value Configuration Class** | Pre-compile time | X | VARIANT-PRE-COMPILE |
| | Link time | – | |
| | Post-build time | X | VARIANT-POST-BUILD |
| **Scope / Dependency** | scope: ECU dependency: ComMPncSupport | | |

⌋

### 10.2.4 ComMUser

### [ECUC_ComM_00653] Definition of EcucParamConfContainerDef ComMUser ⌈

| Container Name | ComMUser |
|---|---|
| Parent Container | ComMConfigSet |
| Description | This container contains a list of identifiers that are needed to refer to a user in the system which is designated to request Communication modes. |
| Configuration Parameters | |

| Included Parameters | | |
|---|---|---|
| Parameter Name | Multiplicity | ECUC ID |
| ComMUserIdentifier | 1 | [ECUC_ComM_00654] |
| ComMUserEcucPartitionRef | 0..1 | [ECUC_ComM_00786] |

| No Included Containers |
|---|

⌋

### [ECUC_ComM_00654] Definition of EcucIntegerParamDef ComMUserIdentifier ⌈

| Parameter Name | ComMUserIdentifier | | |
|---|---|---|---|
| Parent Container | ComMUser | | |
| Description | An identifier that is needed to refer to a user in the system which is designated to request Communication Modes.<br><br>ImplementationType: ComM_UserHandleType | | |
| Multiplicity | 1 | | |
| Type | EcucIntegerParamDef (Symbolic Name generated for this parameter) | | |
| Range | 0 .. 65534 | | |
| Default value | – | | |
| Post-Build Variant Value | false | | |
| Value Configuration Class | Pre-compile time | X | All Variants |
| | Link time | – | |
| | Post-build time | – | |
| Scope / Dependency | scope: local<br><br>dependency: EcuMUser: The concept of users is very similar to the concept of requestors in the ECU State Manager specification. These two parameters shall be harmonized during the configuration process.<br><br>withAuto = true | | |

⌋

## [ECUC_ComM_00786] Definition of EcucReferenceDef ComMUserEcucPartition Ref ⌈

| Parameter Name | ComMUserEcucPartitionRef | | |
|---|---|---|---|
| Parent Container | ComMUser | | |
| Description | Denotes in which "EcucPartition" the requester is executed. When the partition is stopped, the communication request shall be cancelled in the ComM to avoid a stay-awake situation of the bus due to a stopped partition. | | |
| Multiplicity | 0..1 | | |
| Type | Reference to EcucPartition | | |
| Post-Build Variant Multiplicity | false | | |
| Post-Build Variant Value | false | | |
| Multiplicity Configuration Class | Pre-compile time | X | All Variants |
| | Link time | – | |
| | Post-build time | – | |
| Value Configuration Class | Pre-compile time | X | All Variants |
| | Link time | – | |
| | Post-build time | – | |
| Scope / Dependency | scope: ECU | | |

⌋

## 10.2.5 ComMChannel

## [ECUC_ComM_00565] Definition of EcucParamConfContainerDef ComMChannel ⌈

| Container Name | ComMChannel |
|---|---|
| **Parent Container** | ComMConfigSet |
| **Description** | This container contains the configuration (parameters) of the bus channel(s). The channel parameters shall be harmonized within the whole communication stack. |
| **Configuration Parameters** | |

| Included Parameters | | |
|---|---|---|
| **Parameter Name** | **Multiplicity** | **ECUC ID** |
| ComMBusType | 1 | [ECUC_ComM_00567] |
| ComMCDDBusPrefix | 0..1 | [ECUC_ComM_00888] |
| ComMChannelId | 1 | [ECUC_ComM_00635] |
| ComMDynamicPncToChannelMappingEnabled | 0..1 | [ECUC_ComM_00896] |
| ComMFullCommRequestNotificationEnabled | 1 | [ECUC_ComM_00787] |
| ComMMainFunctionPeriod | 1 | [ECUC_ComM_00556] |
| ComMNoCom | 1 | [ECUC_ComM_00571] |
| ComMNoWakeup | 1 | [ECUC_ComM_00569] |
| ComMNoWakeUpInhibitionNvmStorage | 1 | [ECUC_ComM_00789] |
| ComMPncGatewayType | 0..1 | [ECUC_ComM_00842] |
| ComMWakeupSleepRequestEnabled | 0..1 | [ECUC_ComM_00898] |
| ComMChannelPartitionRef | 0..1 | [ECUC_ComM_00894] |
| ComMManageReference | 0..* | [ECUC_ComM_00893] |

| Included Containers | | |
|---|---|---|
| **Container Name** | **Multiplicity** | **Scope / Dependency** |
| ComMNetworkManagement | 1 | This container contains the configuration parameters of the networkmanagement. |
| ComMUserPerChannel | 0..255 | This container contains a list of identifiers that are needed to refer to a user in the system which is linked to a channel. |

⌋

## [ECUC_ComM_00567] Definition of EcucEnumerationParamDef ComMBusType

⌈

| Parameter Name | ComMBusType | |
|---|---|---|
| **Parent Container** | ComMChannel | |
| **Description** | Identifies the bus type of the channel. | |
| **Multiplicity** | 1 | |
| **Type** | EcucEnumerationParamDef | |
| **Range** | COMM_BUS_TYPE_CAN | – |
| | COMM_BUS_TYPE_CDD | – |
| | COMM_BUS_TYPE_ETH | – |
| | COMM_BUS_TYPE_FR | – |
| | COMM_BUS_TYPE_INTERNAL | – |
| | COMM_BUS_TYPE_LIN | – |
| **Post-Build Variant Value** | false | |

▽

△

| Value Configuration Class | Pre-compile time | X | All Variants |
|---|---|---|---|
| | Link time | – | |
| | Post-build time | – | |

⌋

## [ECUC_ComM_00888] Definition of EcucStringParamDef ComMCDDBusPrefix ⌈

| Parameter Name | ComMCDDBusPrefix | | |
|---|---|---|---|
| Parent Container | ComMChannel | | |
| Description | Prefix to be used for API calls to CDD. | | |
| Multiplicity | 0..1 | | |
| Type | EcucStringParamDef | | |
| Default value | – | | |
| Regular Expression | – | | |
| Post-Build Variant Multiplicity | false | | |
| Post-Build Variant Value | false | | |
| Multiplicity Configuration Class | Pre-compile time | X | All Variants |
| | Link time | – | |
| | Post-build time | – | |
| Value Configuration Class | Pre-compile time | X | All Variants |
| | Link time | – | |
| | Post-build time | – | |
| Scope / Dependency | scope: local | | |
| | dependency: Only applicable if ComMBusType equals COMM_BUS_TYPE_CDD. | | |

⌋

## [ECUC_ComM_00635] Definition of EcucIntegerParamDef ComMChannelId ⌈

| Parameter Name | ComMChannelId | | |
|---|---|---|---|
| Parent Container | ComMChannel | | |
| Description | Channel identification number of the corresponding channel. | | |
| Multiplicity | 1 | | |
| Type | EcucIntegerParamDef (Symbolic Name generated for this parameter) | | |
| Range | 0 .. 255 | | |
| Default value | – | | |
| Post-Build Variant Value | false | | |
| Value Configuration Class | Pre-compile time | X | All Variants |
| | Link time | – | |
| | Post-build time | – | |

▽

△

| Scope / Dependency | scope: ECU |
| --- | --- |
| | dependency: Shall be harmonized with channel IDs of networkmanagement and the bus interfaces. |
| | withAuto = true |

⌋

## [ECUC_ComM_00896]  Definition of EcucBooleanParamDef ComMDynamicPnc ToChannelMappingEnabled ⌈

| Parameter Name | ComMDynamicPncToChannelMappingEnabled | | |
| --- | --- | --- | --- |
| Parent Container | ComMChannel | | |
| Description | Channel-specific parameter to enable the dynamic PNC-to-channel-mapping feature. | | |
| | False: Dynamic PNC-to-channel-mapping is disabled True: Dynamic PNC-to-channel-mapping is enabled | | |
| Multiplicity | 0..1 | | |
| Type | EcucBooleanParamDef | | |
| Default value | false | | |
| Post-Build Variant Multiplicity | false | | |
| Post-Build Variant Value | false | | |
| Multiplicity Configuration Class | Pre-compile time | X | VARIANT-PRE-COMPILE |
| | Link time | X | VARIANT-POST-BUILD |
| | Post-build time | – | |
| Value Configuration Class | Pre-compile time | X | VARIANT-PRE-COMPILE |
| | Link time | X | VARIANT-POST-BUILD |
| | Post-build time | – | |
| Scope / Dependency | scope: local | | |
| | dependency: Shall only be TRUE if ComMDynamicPncToChannelMappingSupport is TRUE and ComMNmVariant is set to FULL for this ComMChannel. | | |

⌋

## [ECUC_ComM_00787] Definition of EcucBooleanParamDef ComMFullCommRe-questNotificationEnabled ⌈

| Parameter Name | ComMFullCommRequestNotificationEnabled | | |
| --- | --- | --- | --- |
| Parent Container | ComMChannel | | |
| Description | Defines if the optional SenderReceiver Port of Interface ComM_CurrentChannel Request will be provided for this channel. True means enabled. False means disabled | | |
| Multiplicity | 1 | | |
| Type | EcucBooleanParamDef | | |
| Default value | false | | |
| Post-Build Variant Value | false | | |
| Value Configuration Class | Pre-compile time | X | All Variants |
| | Link time | – | |
| | Post-build time | – | |

▽

△

| Scope / Dependency | scope: local |
|---|---|
| | dependency: Shall be stored none volatile (value must be kept during a reset). |

⌟

## [ECUC_ComM_00556] Definition of EcucFloatParamDef ComMMainFunctionPeriod ⌈

| Parameter Name | ComMMainFunctionPeriod |
|---|---|
| Parent Container | ComMChannel |
| Description | Specifies the period in seconds that the MainFunction has to be triggered with. |
| | Comment: ComM scheduling shall be at least as fast as the communication stack and a schedule longer than 100ms makes no sense for communication. |
| Multiplicity | 1 |
| Type | EcucFloatParamDef |
| Range | ]0 .. INF[ | |
| Default value | 0.02 |
| Post-Build Variant Value | false |
| Value Configuration Class | Pre-compile time | X | All Variants |
| | Link time | – | |
| | Post-build time | – | |
| Scope / Dependency | scope: ECU |

⌟

## [ECUC_ComM_00571] Definition of EcucBooleanParamDef ComMNoCom ⌈

| Parameter Name | ComMNoCom |
|---|---|
| Parent Container | ComMChannel |
| Description | Not allowed to change state of ComM channel to COMM_SILENT_COMMUNICATION or COMM_FULL_COMMUNICATION. |
| | true: Enabled - Not allowed to switch to Communication Modes above. false: Disabled - Allowed to switch Communication Modes above. |
| | Shall be possible to change parameter during runtime with ComM API's. ECU/All channels: ComM_LimitECUToNoComMode(). Separate channels: ComM_Limit ChannelToNoComMode(). |
| Multiplicity | 1 |
| Type | EcucBooleanParamDef |
| Default value | false |
| Post-Build Variant Value | false |
| Value Configuration Class | Pre-compile time | X | All Variants |
| | Link time | – | |
| | Post-build time | – | |
| Scope / Dependency | scope: local |
| | dependency: ComMModeLimitationEnabled |

⌟

### [ECUC_ComM_00569] Definition of EcucBooleanParamDef ComMNoWakeup ⌈

| Parameter Name | ComMNoWakeup |
|---|---|
| **Parent Container** | ComMChannel |
| **Description** | Defines if an ECU is not allowed to wake-up the channel. true: Enabled (not allowed to wake-up)) false: Disabled |
| | This is the default/init value of a runtime variable that can be changed during runtime using ComM_PreventWakeUp(). |
| **Multiplicity** | 1 |
| **Type** | EcucBooleanParamDef |
| **Default value** | false |
| **Post-Build Variant Value** | false |
| **Value Configuration Class** | Pre-compile time | X | All Variants |
| | Link time | – | |
| | Post-build time | – | |
| **Scope / Dependency** | scope: local |
| | dependency: Shall be stored none volatile (value must be kept during a reset). |

⌋

### [ECUC_ComM_00789] Definition of EcucBooleanParamDef ComMNoWakeUpInhibitionNvmStorage ⌈

| Parameter Name | ComMNoWakeUpInhibitionNvmStorage |
|---|---|
| **Parent Container** | ComMChannel |
| **Description** | If this parameter is set to "true", the NoWakeUp inhibition state of the channel shall be stored (in some implementation specific way) in the block pointed to by ComMGlobal NvmBlockDescriptor. |
| **Multiplicity** | 1 |
| **Type** | EcucBooleanParamDef |
| **Default value** | – |
| **Post-Build Variant Value** | false |
| **Value Configuration Class** | Pre-compile time | X | All Variants |
| | Link time | – | |
| | Post-build time | – | |
| **Scope / Dependency** | scope: local |
| | dependency: If the parameter is set to true, a valid Nvm block reference must be given in the (existing, i.e. multiplicity 1) ComMGlobalNvmBlockDescriptor pointing to a sufficiently big Nvm block. |

⌋

### [ECUC_ComM_00842] Definition of EcucEnumerationParamDef ComMPncGatewayType ⌈

| Parameter Name | ComMPncGatewayType |
|---|---|
| **Parent Container** | ComMChannel |
| **Description** | Identifies the Partial Network Gateway behaviour of a ComMChannel. |

▽

$\triangle$

| Multiplicity | 0..1 | | |
|---|---|---|---|
| Type | EcucEnumerationParamDef | | |
| Range | COMM_GATEWAY_TYPE_ ACTIVE | – | |
| | COMM_GATEWAY_TYPE_ PASSIVE | – | |
| Default value | COMM_GATEWAY_TYPE_ACTIVE | | |
| Post-Build Variant Multiplicity | false | | |
| Post-Build Variant Value | false | | |
| Multiplicity Configuration Class | Pre-compile time | X | All Variants |
| | Link time | – | |
| | Post-build time | – | |
| Value Configuration Class | Pre-compile time | X | All Variants |
| | Link time | – | |
| | Post-build time | – | |
| Scope / Dependency | scope: ECU dependency: Parameter shall not be used for managed channel (shall neither be set to COMM_GATEWAY_TYPE_ACTIVE nor COMM_GATEWAY_TYPE_PASSIVE). | | |

⌋

## [ECUC_ComM_00898] Definition of EcucBooleanParamDef ComMWakeupSleep RequestEnabled ⌈

| Parameter Name | ComMWakeupSleepRequestEnabled | | |
|---|---|---|---|
| Parent Container | ComMChannel | | |
| Description | Used for communication channels where the corresponding hardware support wake-up and/or sleep request capability on the network, e.g. OA TC10 compatible PHYs for Ethernet. | | |
| Multiplicity | 0..1 | | |
| Type | EcucBooleanParamDef | | |
| Default value | false | | |
| Post-Build Variant Multiplicity | false | | |
| Post-Build Variant Value | false | | |
| Multiplicity Configuration Class | Pre-compile time | X | All Variants |
| | Link time | – | |
| | Post-build time | – | |
| Value Configuration Class | Pre-compile time | X | All Variants |
| | Link time | – | |
| | Post-build time | – | |
| Scope / Dependency | scope: local dependency: Only applicable if ComMBusType equals COMM_BUS_TYPE_ETH and the used Ethernet hardware (e.g. PHY, Ethernet switch) is compatible with the OA TC10 specification. | | |

⌋

### [ECUC_ComM_00894] Definition of EcucReferenceDef ComMChannelPartition Ref ⌈

| Parameter Name | ComMChannelPartitionRef | | |
|---|---|---|---|
| Parent Container | ComMChannel | | |
| Description | Reference to EcucPartition, where the according ComMChannel is assigned to. | | |
| Multiplicity | 0..1 | | |
| Type | Reference to EcucPartition | | |
| Post-Build Variant Multiplicity | false | | |
| Post-Build Variant Value | false | | |
| Multiplicity Configuration Class | Pre-compile time | X | All Variants |
| | Link time | – | |

| Scope / Dependency | scope: local<br><br>dependency: Only used if ComMNmVariant is configured as ComMLight | |

⌋

## [ECUC_ComM_00568] Definition of EcucEnumerationParamDef ComMNmVariant ⌈

| Parameter Name | ComMNmVariant | |
|---|---|---|
| Parent Container | ComMNetworkManagement | |
| Description | Defines the functionality of the networkmanagement. Shall be harmonized with NM configuration. | |
| Multiplicity | 1 | |
| Type | EcucEnumerationParamDef | |
| Range | FULL | AUTOSAR NM is available (default). |
| | LIGHT | No AUTOSAR NM is available, but functionality to shut down a channel. |
| | NONE | No NM available |
| | PASSIVE | AUTOSAR NM running in passive mode available. |
| | SLAVE_ACTIVE | No NM is available. This is used for e.g. LIN slaves. |
| | SLAVE_PASSIVE | No NM is available. This used for e.g. Ethernet communication channels with OA TC10 compliant hardware. |
| Default value | FULL | |
| Post-Build Variant Value | false | |
| Value Configuration Class | Pre-compile time | X | All Variants |
| | Link time | – | |
| | Post-build time | – | |
| Scope / Dependency | scope: local dependency: ComMNmVariant shall be NONE if ComMBusType = COMM_BUS_TYPE_INTERNAL. ComMNmVariant shall be LIGHT for managed channels. ComMNmVariant shall be FULL for managing channels. | |

⌋

## [ECUC_ComM_00886] Definition of EcucBooleanParamDef ComMPncNmRequest ⌈

| Parameter Name | ComMPncNmRequest | |
|---|---|---|
| Parent Container | ComMNetworkManagement | |
| Description | If this parameter equals true, then Nm shall be requested again by calling Nm_Network Request under either the following conditions: - every time a FULL Communication is requested due to a change in the PNC state machine to COMM_PNC_REQUESTED - if a shutdown for a PNC coincides with a PNC request of the same PNC | |
| Multiplicity | 1 | |
| Type | EcucBooleanParamDef | |
| Default value | false | |
| Post-Build Variant Value | false | |
| Value Configuration Class | Pre-compile time | X | All Variants |
| | Link time | – | |
| | Post-build time | – | |

▽

△

| Scope / Dependency | scope: local |
|---|---|
| | dependency: It shall only be possible to set ComMPncNmRequest to TRUE, if Com MNmVariant is FULL. |

⌋
