1 Introduction and functional overview

This specification describes the functionality, API and the configuration for the AUTOSAR Basic Software module L-SDU Router. The L-SDU Router module provides services for routing L-SDUs (Link Layer Service Data Units) using the following module types:

- Communication interface modules, that use the `<Provider:Up>` or `<Provider:Lo>` APIs, e.g. EthIf, IEEE1722Tp;

The routing of L-SDUs is performed based on statically defined L-SDU identifiers. Thus, no L-SDU is routed dynamically during run-time, e.g. dependent on its payload.

The location of related modules can be "upper layer modules" (e.g. IEEE1722Tp) and/or "lower layer modules" (e.g. EthIf).

The L-SDU Router act as mandatory upper layer of all communication interface modules and as mandatory lower layer of all direct linked modules, e.g. PduR, <Bus>Nm, <Bus>Tp, <Bus>TSyn, XCPon<Bus>, TcpIp, Firewall, Busmirroring, SAEJ1939Nm, SAEJ1939Tp, V2XGeoNetworking module.

The L-SDU Router and PDU Router share similar functionality and therefore the configuration and implementation could result in one module.

The L-SDU Router can be easily configured to support other upper and lower layer modules. This approach also allows to integrate Complex Device Drivers (CDDs) as upper or lower layer modules of the L-SDU Router.

1.1 AUTOSAR architecture

The L-SDU Router act as central module in the AUTOSAR communication structure between the communication hardware abstraction layer and communication service layer.

Figure 1.1 gives an overview of the AUTOSAR communication structure

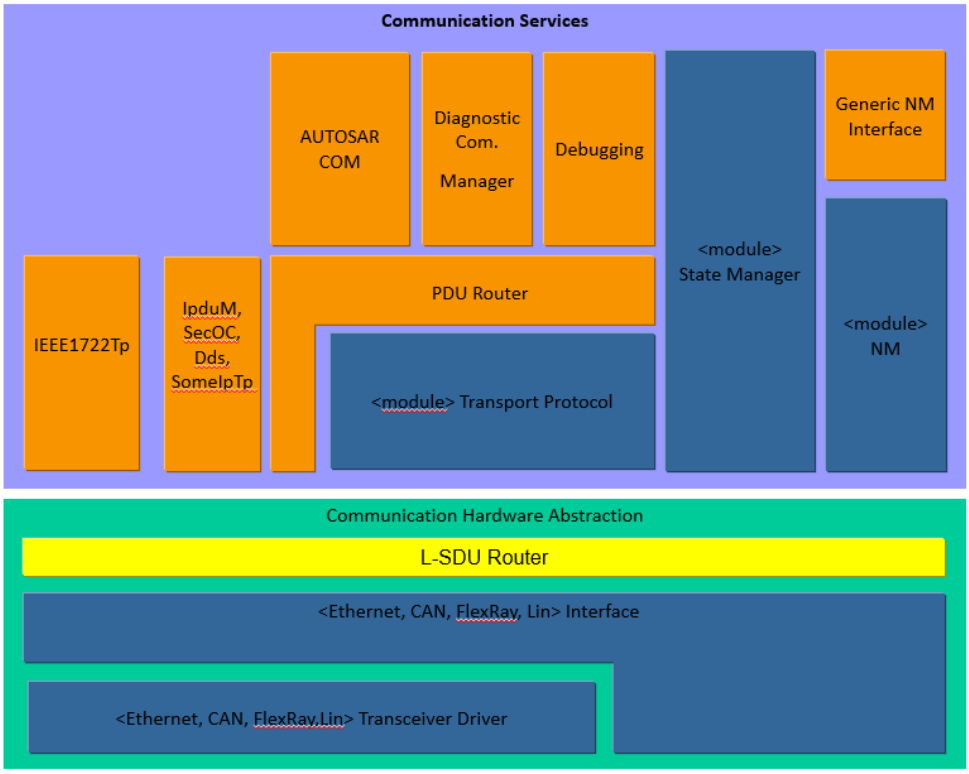

Figure 1.1: Communication Structure

1.2 L-SDU Router module function overview

The detailed L-SDU Router module structure is shown in Figure 1.2.

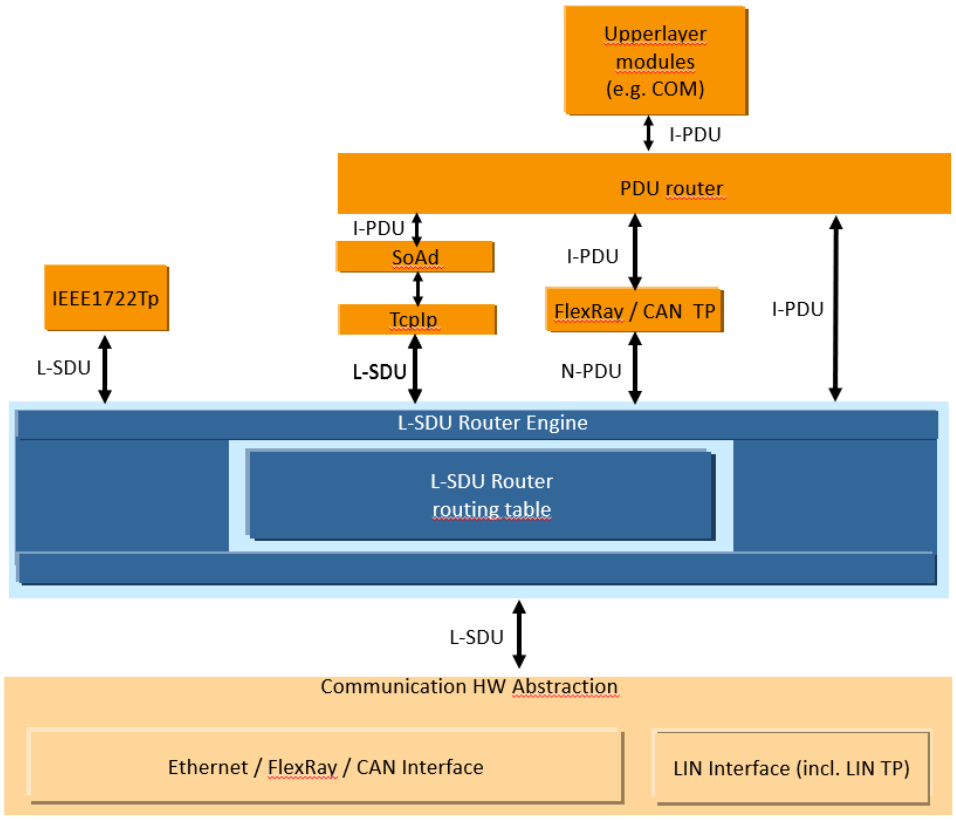

Figure 1.2: Detailed L-SDU Router Structure

The L-SDU Router module mainly consists of two parts:

- The **L-SDU Router routing paths**: static routing paths describing the routing attributes for each L-SDU to be routed. The routing paths can be (if supported) updated post-build loadable in the programming state of the ECU or selected when initializing the L-SDU Router by post-build selectable (see section 10.1.1).
- The **L-SDU Router Engine**: the actual code performing routing actions according to the L-SDU Router routing paths. The L-SDU Router Engine has to deal with:
  - Routing L-SDU from source(s) to destination(s),
  - Translating the source L-SDU ID to the destination L-SDU ID (e.g. `LSduR_IEEE1722Tp_RxIndication` to `IEEE1722Tp_RxIndication`,

1.3 L-SDU handling

L-SDUs are identified by static L-SDU IDs. The L-SDU Router module determines the destination of an L-SDU by using the L-SDU ID in a static configuration table. L-SDUs are used for the data exchange of the modules directly above the L-SDU Router module, e.g. the IEEE1722Tp module. The routing operation of the L-SDU Router module does not modify the L-SDU, it simply forwards the L-SDU to the destination module.

The L-SDU ID is set in the configuration that also implements the API. This will allow an efficient implementation of look-up tables in each module receiving an L-SDU ID (e.g. the L-SDU Router module's configuration contains the L-SDU ID for the `LSduR_EthIfTxConfirmation`, while EthIf module's configuration contains the L-SDU ID for the `EthIf_Transmit`).

The following list summarizes the routing capabilities of LSduR:

1. L-SDU Forwarding
    - Transmission from upper layer
        - Communication Interface
            * Singlecast (1:1) an L-SDU from a local module to a communication interface module.
            * Multicast (1:n) an L-SDU from a local module to communication interface modules.
    - Reception to upper layer
        - Communication Interface
            * Singlecast (1:1) an L-SDU from a communication interface module to a local module.
            * Multicast (1:n) an I-PDU from a communication interface module to local modules.
            * Fan-in (n:1) an I-PDU from communication interface modules to a local module.

2 Acronyms and Abbreviations

The glossary below includes acronyms and abbreviations relevant to the LSduR module that are not included in the [1, AUTOSAR glossary].

Abbreviation / Acronym:	Description:
PDU	Protocol Data Unit.
I-PDU	Interaction Layer PDU. An I-PDU consists of data (buffer), length and I-PDU ID.
I-PDU ID	I-PDU Identifier.
L-PDU	Data Link Layer PDU. One or more I-PDUs are packed into one L-PDU. The L-PDU is bus specific, e.g. Ethernet frame.
L-PDU ID	L-PDU Identifier.
SDU	Service Data Unit.
L-SDU	Data link layer service data unit. An L-SDU consists of data(buffer), length, L-SDU ID and may L-PDU specific information transported via meta data.
L-SDU ID	L-SDU identifier
L-SDU Router	Module that transfers L-SDUs from one module to another module. The L-SDU Router module can be utilized for internal routing purposes.
Upper Layer Modules (Up)	Modules above the L-SDU Router. This layer includes e.g. PDU Router, IEEE1722Tp or TcpIp module.
Lower Layer Modules (Lo)	Module that transfers L-SDUs from one module to another module. The L-SDU Router module can be utilized for internal routing purposes, and in combination with PDU Router for gateway operations.
<SrcLo>	Lower layer Communication Interface module acting as a source of the L-SDU. The SrcLo is always one.
<DstLo>	Lower layer Communication Interface module acting as a destination of the L-SDU. The DstLo may by one to many.
<Lo>	Lower layer communication interface module.
<Up>	Upper layer communication Interface module
multicast operation	Simultaneous transmission of L-SDUs to a group of receivers, i.e. 1:n routing.
data provision	Provision of data to interface modules. (a) `direct data provision`: data to be transmitted are provided directly at the transmit request. The destination Communication Interface may behave in two ways, either copy the data directly or defer the copy to a trigger transmit. (b) `trigger transmit data provision`: data to be transmitted are not provided at the transmit request, but will be retrieved by the Communication Interface module via a callback function.

3.2 Related specification

AUTOSAR provides a General Specification on Basic Software modules [2, SWS BSW General], which is also valid for LSduR.

Thus, the specification SWS BSW General shall be considered as additional and required specification for LSduR.

4 Constraints and assumptions

4.1 Limitations

The L-SDU Router module does not:

- have mechanisms for signal extraction or conversion,
- have mechanisms for data integrity checking (like checksums),
- change or modify the L-SDU,
- make any L-SDU payload dependent routing decisions,
- support routing of I-PDUs between Communication Interface modules with rate conversion.

4.1.1 Limitations on supported functionality

The L-SDU Router module supports fan-out of L-SDUs transmitted from a local module (e.g. IEEE1722Tp) to more than one destinations. There are some limitations if the L-SDU shall be transmitted to more than one destination (fan-out 1:n; n>1), because the upper layer module is not aware how many destinations there are:

- The L-SDU Router reports `E_OK` for a `Transmit` request from an upper layer if at least one destination lower layer reports `E_OK`.
- The L-SDU Router gives a `TxConfirmation` to the upper layer when it receives the last `TxConfirmation` from destination lower layer.
- The L-SDU Router returns `E_OK` for a `ReleaseRxBuffer` requested from the upper layer only if all destination lower layers return `E_OK`.

If the L-SDU fan-out is performed by the L-SDU Router, this has further consequences for upper layer module (e.g. IEEE1722Tp module):

- The `TxConfirmation` of the Communication Interface API will be handled in the way that the local module (e.g. IEEE1722Tp module) will be informed when the last destination has confirmed the transmission.

Note that above limitations are not set as requirements since they do not concern functionality provided by the L-SDU router module. But implication of the use of the L-SDU Router module will affect these functionalities.

4.2 Applicability to car domains

The L-SDU Router is used in all ECUs where communication is necessary.

5 Dependencies to other modules

The L-SDU Router module depends on the APIs and capabilities of the used communication hardware abstraction layer modules and the used communication service layer modules. Basically the API functions required by the L-SDU Router module are:

Communication Interface modules:

- `<Lo>_Transmit` (e.g. `EthIf_Transmit`)

Upper layer modules which process I-PDUs originating from Communication Interface modules:

- `<Up>_RxIndication` (e.g. `IEEE1722Tp_RxIndication`),
- `<Up>_TxConfirmation` (e.g. `IEEE1722Tp_TxConfirmation`)

5.1 File structure

5.1.1 Code file structure

For details refer to the Chapter 5.1.6 "Code file structure" in [2, SWS_BSWGeneral].

The code file structure is not defined within this specification completely. However to allow integration to other modules the following structure is needed.

5.1.2 Header file structure

[CP_SWS_LSduR_00001]
Status: DRAFT
Upstream requirements: SRS_BSW_00415

⌈The L-SDU Router module shall provide the functions used by the different modules in separate header files.⌋

Example: If EthIf is used then the L-SDU Router module shall provide `LSduR_EthIf.h`.

[CP_SWS_LSduR_00002]
Status: DRAFT
Upstream requirements: SRS_BSW_00350

⌈The L-SDU Router implementation shall include `Det.h`.⌋

[CP_SWS_LSduR_00003]

Status: DRAFT
Upstream requirements: SRS_BSW_00003

⌈All L-SDU Router header files shall contain a software and specification version number.⌋

This structure allows the separation between platform, compiler and implementation specific definitions and declarations from general definitions as well as the separation of source code and configuration.

5.2 Version check

For details refer to the chapter 5.1.8 "Version Check" in [2, SWS_BSWGeneral].

6 Requirements Tracing

The following tables reference the requirements specified in [3, CP_SRS_BSWGeneral] and [4, CP_SRS_Gateway] and links to the fulfillment of these. Please note that if column “Satisfied by” is empty for a specific requirement this means that this requirement is not fulfilled by this document.

Requirement	Description	Satisfied by
[SRS_BSW_00003]	All software modules shall provide version and identification information	[CP_SWS_LSduR_00003]
[SRS_BSW_00101]	The Basic Software Module shall be able to initialize variables and hardware in a separate initialization function	[CP_SWS_LSduR_91006] [CP_SWS_LSduR_91007]
[SRS_BSW_00305]	Data types naming convention	[CP_SWS_LSduR_91003] [CP_SWS_LSduR_91004] [CP_SWS_LSduR_91005]
[SRS_BSW_00310]	API naming convention	[CP_SWS_LSduR_00033] [CP_SWS_LSduR_91006] [CP_SWS_LSduR_91007] [CP_SWS_LSduR_91008] [CP_SWS_LSduR_91009] [CP_SWS_LSduR_91011] [CP_SWS_LSduR_91012] [CP_SWS_LSduR_91013] [CP_SWS_LSduR_91014]
[SRS_BSW_00323]	All AUTOSAR Basic Software Modules shall check passed API parameters for validity	[CP_SWS_LSduR_00034] [CP_SWS_LSduR_91001]
[SRS_BSW_00335]	Status values naming convention	[CP_SWS_LSduR_91005]
[SRS_BSW_00337]	Classification of development errors	[CP_SWS_LSduR_91001]
[SRS_BSW_00350]	All AUTOSAR Basic Software Modules shall allow the enabling/ disabling of detection and reporting of development errors.	[CP_SWS_LSduR_00002]
[SRS_BSW_00358]	The return type of init() functions implemented by AUTOSAR Basic Software Modules shall be void	[CP_SWS_LSduR_91006] [CP_SWS_LSduR_91007]
[SRS_BSW_00384]	The Basic Software Module specifications shall specify at least in the description which other modules they require	[CP_SWS_LSduR_91015] [CP_SWS_LSduR_91016]
[SRS_BSW_00400]	Parameter shall be selected from multiple sets of parameters after code has been loaded and started	[CP_SWS_LSduR_91003]
[SRS_BSW_00404]	BSW Modules shall support post-build configuration	[CP_SWS_LSduR_00035] [CP_SWS_LSduR_00037] [CP_SWS_LSduR_00038] [CP_SWS_LSduR_00039] [CP_SWS_LSduR_91003]
[SRS_BSW_00405]	BSW Modules shall support multiple configuration sets	[CP_SWS_LSduR_91004]
[SRS_BSW_00406]	API handling in uninitialized state	[CP_SWS_LSduR_00026] [CP_SWS_LSduR_00027] [CP_SWS_LSduR_00028] [CP_SWS_LSduR_00029] [CP_SWS_LSduR_00030] [CP_SWS_LSduR_00031] [CP_SWS_LSduR_00032] [CP_SWS_LSduR_91005]
[SRS_BSW_00414]	Init functions shall have a pointer to a configuration structure as single parameter	[CP_SWS_LSduR_91006] [CP_SWS_LSduR_91007]
[SRS_BSW_00415]	Interfaces which are provided exclusively for one module shall be separated into a dedicated header file	[CP_SWS_LSduR_00001]

△

Requirement	Description	Satisfied by
[SRS_BSW_00438]	Configuration data shall be defined in a structure	[CP_SWS_LSduR_00035] [CP_SWS_LSduR_91003]
[SRS_BSW_00452]	Classification of runtime errors	[CP_SWS_LSduR_91001]
[SRS_BSW_00459]	It shall be possible to concurrently execute a service offered by a BSW module in different partitions	[CP_SWS_LSduR_00049]
[SRS_BSW_00460]	Reentrancy Levels	[CP_SWS_LSduR_00049]
[SRS_GTW_06001]	Gateway shall be only be reconfigured while the configuration table to be reconfigured is not in use	[CP_SWS_LSduR_00031] [CP_SWS_LSduR_00038]
[SRS_GTW_06002]	The `Routing Configuration` shall be updateable at post-build time	[CP_SWS_LSduR_00037]
[SRS_GTW_06097]	A `Routing Configuration` shall be identified by an unique ID number	[CP_SWS_LSduR_00036] [CP_SWS_LSduR_00039] [CP_SWS_LSduR_91004] [CP_SWS_LSduR_91008]
[SRS_GTW_06119]	Confirmation in case of multicast	[CP_SWS_LSduR_00043]
[SRS_GTW_06125]	Multicast implementation in PduR shall behave such that the source module does not need to know that there is more than one destination module configured	[CP_SWS_LSduR_00042] [CP_SWS_LSduR_00043]
[SRS_GTW_06126]	Routing of non-TP PDUs from more than one source to one destination using a FIFO shall be supported by the PDU Router	[CP_SWS_LSduR_00040] [CP_SWS_LSduR_00041]

Table 6.1: Requirements Tracing

7 Functional specification

The L-SDU Router module is an L-SDU transfer unit placed above Communication Interface modules (lower layer module) and below the modules of of the Communication Services (upper layer module), see Figure 1.1.

For example, the IEEE1722Tp module [5] support IEEE1722-stream related communication and resides in the Communication Service layer. The IEEE1722Tp module is the upper layer module, which request transmission by calling `Transmit` of the the L-SDU Router module. The L-SDU Router module forward reception of data by calling `RxIndication` or indicate transmission confirmation by calling `TxConfirmation` of the IEEE1722Tp module.

From the ECU point of view, the L-SDU Router module can perform two different classes of operations:

- **PDU Reception to local module(s)**:
  - receive L-SDUs from one lower layer module and forward them to one or more upper layer modules,
- **PDU Transmission from local module(s)**: transmit L-SDUs to one lower layer module on request of one upper layer module,

The combination of L-SDU Reception and L-SDU Gateway via the PduR is allowed. Example: The IEEE1722Tp module is receiving an L-SDU in the same time that it is gatewayed via the PduR to another lower layer module.

[CP_SWS_LSduR_00004]

Status: DRAFT

⌈When the LSduR reports a development, runtime, or transient error, it shall use the `moduleId` of the caller module as `instanceId` when calling the Default Error Tracer module.⌋

For example: When an error is detected during the `LSduR_EthIfRxIndication`, `Det_ReportError`(51 (Module id of LSduR), 65 (ModuleId (used as InstanceId) of EthIf), 0x42, `LSDUR_E_PDU_INSTANCES_LOST`) shall be called.

Note: The standardized module ID is found in the List of Basic Software Modules document [2]. The parameter `LSduRBswModuleRef` identifies the module used. With this information the `moduleId` can be retrieved in the `BswModuleDescription.moduleId`.

7.1 L-SDU handling

[CP_SWS_LSduR_00005]
Status: DRAFT
Upstream requirements: SRS_GTW_06141

⌈The L-SDU Router module shall transfer an L-SDU without modification in a consistent manner from the source module to the destination module(s).⌋

An L-SDU is identified by the L-SDU ID and/or the symbolic name (i.e. the `SymbolicNameValue` of the container of the PDU [6, Specification of ECU Configuration]). For post-build the L-SDU ID is required because the L-SDU must be identified after the L-SDU Router module is compiled. If the L-SDU Router module is pre-compile (i.e. in source code) the symbolic names may be used, see [6, Specification of ECU Configuration].

Each BSW module that handles L-SDUs and provides an API for L-SDUs must contain a list of L-SDU IDs [6]. This means that each called module will have a look-up table identifying the PDU.

Example: The IEEE1722Tp module calls `LSduR_IEEE1722TpTransmit` (here the L-SDU Router module configuration contains the L-SDU ID), the L-SDU Router module will call `EthIf_Transmit` (here the EthIf module configuration contains the L-SDU ID), the EthIf will call `LSduR_EthIfTxConfirmation` (here the L-SDU Router module configuration contains the L-SDU ID), and L-SDU Router module will call `IEEE1722Tp_TxConfirmation` (here the IEEE1722Tp module configuration contains the L-SDU ID). The example is illustrated in the following Figure 7.1 (only L-SDU ID is shown as parameter):

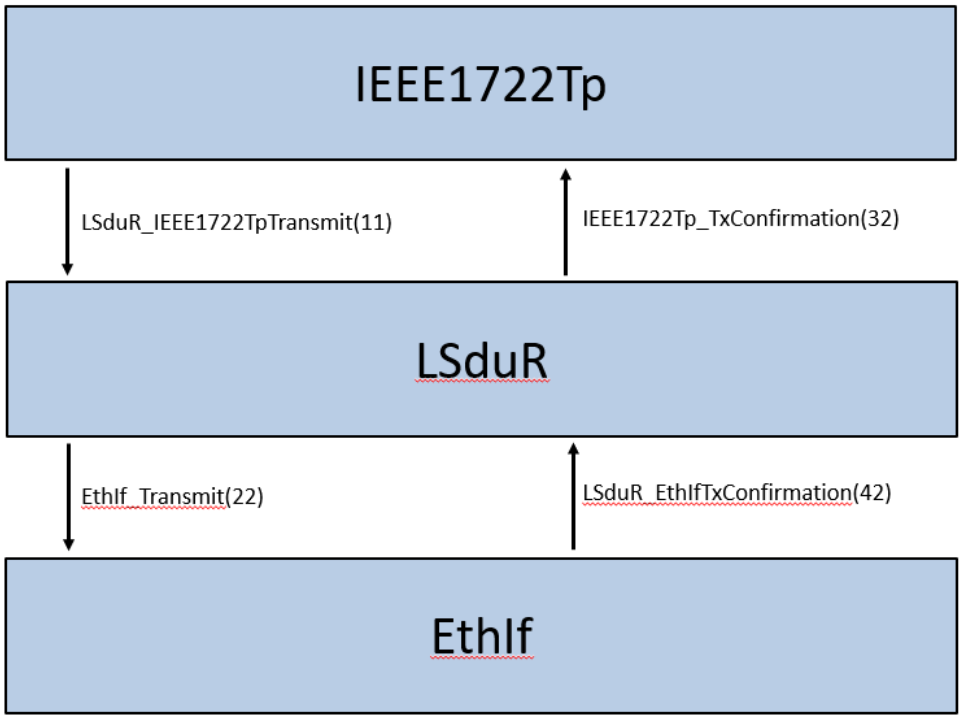

Figure 7.1: I-SDU ID Example

[CP_SWS_LSduR_00006]
Status: DRAFT
Upstream requirements: SRS_GTW_06141

⌈The L-SDU Router module shall identify a routing path uniquely by the combination of source module L-SDU ID (located in the L-SDU Router configuration) and destination L-SDU IDs (located in the called destination module configurations).⌋

[CP_SWS_LSduR_00007]
Status: DRAFT
Upstream requirements: SRS_GTW_06141

⌈The L-SDU Router module shall convert the L-SDU ID to the destination module(s) for both `Transmit` path and `TxConfirmation/RxIndication/ReleaseRxBuffer` path.⌋

Example: The IEEE1722Tp module transmits an L-SDU to EthIf. The `LSduR_IEEE1722TpTransmit` is called. The L-SDU Router module will convert the source L-SDU ID (L-SDU Router module configuration) to one L-SDU ID for EthIf (EthIf module configuration). The `PduInfoType` value received from the IEEE1722Tp module is copied to the EthIf module without change.

Example: The EthIf module will call `LSduR_EthIfTxConfirmation` with an L-SDU ID and, dependent on the success of the transmission, with a `result` `E_OK` (successful transmission) or `E_NOT_OK` (not successful transmission). Then the L-

SDU Router module will convert this L-SDU ID and forward the call to IEEE1722Tp using `IEEE1722Tp_TxConfirmation` with the converted L-SDU ID and the received `result`.

[CP_SWS_LSduR_00008]
Status: DRAFT
Upstream requirements: SRS_GTW_06141

⌈The L-SDU Router module shall only route L-SDUs according to the routing paths given in the configuration.⌋

[CP_SWS_LSduR_00009]
Status: DRAFT

⌈LSduR generator (validation) shall deny configurations where L-SDUs with different `MetaDataTypes` are connected by a routing path.⌋

7.1.1 L-SDU Reception to upper layer module

The receive operation of the L-SDU Router module is either finalized by an `RxIndication` (`LSduR_<User:Lo>RxIndication`) from a lower layer module (Communication Interface) or , if configured, by a call of `ReleaseRxBuffer` (`LSduR_<User:Up>ReleaseRxBuffer`) from the receiving upper layer module (e.g. IEEE1722 application) after `RxIndication` from a lower layer module has been called.

The `RxIndication` function is originated from the lower layer either in the context of a cyclic function after polling a communication driver or in the context of an interrupt.

The `ReleaseRxBuffer` function is originated from the upper layer either in context of the `RxIndication` or in the context context of a cyclic function after `RxIndication` has been called.

7.1.1.1 Communication Interface

The source Communication Interface module indicates a received L-SDU by calling `LSduR_<User:Lo>RxIndication`. The L-SDU may have multiple local destination modules configured by the routing path.

[CP_SWS_LSduR_00010] Support of 1:n routing for an received L-SDU
Status: DRAFT
Upstream requirements: SRS_GTW_06141, SRS_GTW_06146

⌈The L-SDU Router module shall provide 1:n routing for an L-SDU received from a Communication Interface module and routed to one or more upper layer module(s).⌋

Example: An L-SDU is received on EthIf and forwarded to IEEE1722Tp.

Note: A L-SDU may be received by one or more upper layer modules in the same time as gatewayed via the PduR to one or more Communication Interface destinations.

[CP_SWS_LSduR_00011]
Status: DRAFT
Upstream requirements: SRS_GTW_06141

⌈When the `LSduR_<User:Lo>RxIndication` is called the L-SDU Router module shall call `<Up>_RxIndication` for each destination upper layer module.⌋

[CP_SWS_LSduR_00012]
Status: DRAFT
Upstream requirements: SRS_GTW_06141

⌈If an L-SDU received by a local module is directly forwarded, the L-SDU Router shall not check the length of the L-SDU.⌋

Since the L-SDU Router module will not buffer this L-SDU it does not have to reject L-SDU that are longer/shorter than configured.

[CP_SWS_LSduR_00040] Support of n:1 routing for L-PDUs
Status: DRAFT
Upstream requirements: SRS_GTW_06126

⌈The L-SDU Router module shall provide n:1 routing for L-PDUs received from multiple communication interface modules to one upper layer module.⌋

[CP_SWS_LSduR_00041] Handling for n:1 routing for L-PDUs
Status: DRAFT
Upstream requirements: SRS_GTW_06126

⌈If `LSduR_<User:Lo>RxIndication` is called for a n:1 routing point and the `<Up>_RxIndication` call of the most recent request has not returned, the L-SDU Router shall return immediately without calling `<Up>_RxIndication` and report `LSDUR_E_PDU_INSTANCES_LOST` to the DET module.⌋

[CP_SWS_LSduR_00013]
Status: DRAFT
Upstream requirements: SRS_GTW_06141

⌈In case of a singlecast (1:1) reception, when upper layer source module calls `LSduR_<User:Up>ReleaseRxBuffer` the L-SDU Router shall call `<Lo>_ReleaseRxBuffer` of the corresponding Communication Interface module.⌋

[CP_SWS_LSduR_00014]
Status: DRAFT
Upstream requirements: SRS_GTW_06141

⌈In case of a multicast (1:n, n>1) reception, the L-SDU Router shall call the `<Lo>_ReleaseRxBuffer` of the corresponding Communication Interface module when the last `LSduR_<User:Up>ReleaseRxBuffer` call of the corresponding upper layer module has been received.⌋

7.1.2 L-SDU Transmission from upper layer module(s)

The transmit operations of the lower layer destination modules are always asynchronous. This means that a transmission service request returns immediately after the I-PDU has been passed by the L-SDU Router module to the lower layer destination(s). If the L-SDU Router module is notified by lower layer destination modules via `LSduR_<User:Lo>TxConfirmation` (Communication Interface) after successful or failed transmission of the L-SDU, the L-SDU Router module will forward this confirmation to the upper layer module via `<Up>_TxConfirmation` (Communication Interface).

The transmit operation of the L-SDU Router module is triggered by a L-SDU `Transmit` request from an upper layer source module and the L-SDU Router forwards the request to lower layer destination(s).

[CP_SWS_LSduR_00015]
Status: DRAFT
Upstream requirements: SRS_GTW_06141

⌈The L-SDU shall not be buffered in the L-SDU Router module in case of L-SDU transmission from an upper layer source module.⌋

7.1.2.1 Multicast

The multicast feature is separated to an own section since there are issues using this feature as described in Section 4.1.1.

Further requirements that are directly handled by the L-SDU Router module:

[CP_SWS_LSduR_00042] Handling of multicast transmission request

Status: DRAFT
Upstream requirements: SRS_GTW_06125

⌈If the provided L-SDU ID represents a group of PDUs (multicast transmit request) and at least one of the forwarded transmit requests returns successfully, the function LSduR_<User:Up>Transmit shall return E_OK.⌋

Note that Communication Interfaces returning with E_OK will transmit their data either directly or via trigger transmit.

[CP_SWS_LSduR_00043] Handling of confirmation upon multicast transmission request

Status: DRAFT
Upstream requirements: SRS_GTW_06125, SRS_GTW_06119

⌈In case of a multicast (1:n, n>1) Communication Interface transmission, the L-SDU Router shall call the transmit confirmation API of the upper layer module when the last transmit confirmation from a Communication Interface module which supports transmit confirmation has been received.⌋

Note: The above requirement even works if not all destinations provide TxConfirmations.

Implementation note: When the source module requests a transmission and the LSduR will make a multicast (1:n, n>1), all the L-SDUs in the request and the multicast will have different L-SDU IDs. Therefore the L-SduR must remember the L-SDU ID from the transmission request so the transmission can be confirmed correctly

7.1.2.2 Communication Interface

There are four ways that L-SDUs can be transmitted on Communication Interface:

1. Direct data provision - where the upper layer module is calling the LSduR_<User:Up>Transmit function, the L-SDU Router module forwards the call to <Lo>_Transmit and the data is copied by the lower Communication Interface module in the call.
2. Trigger transmit provision - where the lower Communication Interface module requests transmission of an L-SDU by using the LSduR_<User:Lo>TriggerTransmit, and L-SDU Router module forwards the call to <Up>_TriggerTransmit and the data is copied to the destination's buffer by the upper layer module.
3. Trigger transmit provision - Where the upper layer module calls the LSduR_<User:Up>Transmit function, the L-SDU Router module forwards the call to <Lo>_Transmit and the data is not copied by the lower module (Com-

munication Interface module). The data will later be requested by the lower layer using LSduR_<User:Lo>TxConfirmation.

The confirmation of the transmission of the L-SDU is the same for the direct and trigger transmit data provision:

[CP_SWS_LSduR_00016]
Status: DRAFT
Upstream requirements: SRS_GTW_06141

⌈When the Communication Interface module calls LSduR_<User:Lo>TxConfirmation the L-SDU Router shall call <Up>_TxConfirmation in the upper layer module and forward the transmission result from the lower to the upper layer module.⌋

[CP_SWS_LSduR_00017]
Status: DRAFT
Upstream requirements: SRS_GTW_06141

⌈If the L-SDU is transmitted by an upper layer module the L-SDU Router module shall not check the length of the L-SDU.⌋

[CP_SWS_LSduR_00018]
Status: DRAFT
Upstream requirements: SRS_GTW_06141

⌈When upper layer source module calls LSduR_<User:Up>Transmit the L-SDU Router shall call <Lo>_Transmit for each Communication Interface destination module.⌋

[CP_SWS_LSduR_00019]
Status: DRAFT
Upstream requirements: SRS_GTW_06141

⌈If singlecast (1:1) the return value of the <Lo>_Transmit call shall be forwarded to the upper layer source module.⌋

7.1.2.2.1 Trigger transmit data provision

The upper layer module must be informed whether it has to reset the update-bits.

[CP_SWS_LSduR_00022]
Status: DRAFT
Upstream requirements: SRS_GTW_06141

⌈The L-SDU Router module shall forward a `LSduR_<User:Lo>TriggerTransmit` request by the Communication Interface lower layer module to the upper layer module by calling `<Up>_TriggerTransmit`.⌋

[CP_SWS_LSduR_00023]
Status: DRAFT
Upstream requirements: SRS_GTW_06143

⌈The L-SDU Router module shall copy the return value from the `<Up>_Trigger Transmit` to the lower layer module.⌋

7.1.2.3 Error handling

For errors occurred using singlecast or multicast over Communication Interface modules, no specific error handling is done. Errors in return values are forwarded to the upper layer source module.

7.2 Zero Cost Operation

Zero cost operation is an optimization that may be done where source and destination modules are single and in source code (one of the modules must be in source code otherwise the L-SDU Router must create glue-code for the function call). For example an ECU with a IEEE1722Tp module and a single Ethernet network, the `LSduR_IEEE1722Transmit` may directly call the `EthIf_Transmit` without any logic inside the L-SDU Router Module. The L-SDU Router becomes a macro layer.

This optimization is only possible where routing paths are of configuration class `Pre-Compile`.

[CP_SWS_LSduR_00024]
Status: DRAFT
Upstream requirements: SRS_GTW_06146

⌈If `LSduRZeroCostOperation` is set to true and all routing paths are of configuration class `Pre-Compile`; modules directly above or below the L-SDU Router may directly call each other without using LSduR module functions.⌋

[CP_SWS_LSduR_00025]
Status: DRAFT
Upstream requirements: SRS_GTW_06146

⌈If `LSduRZeroCostOperation` is set to true and at least one routing path is not of configuration class `Pre-Compile`; the L-SDU Router module configuration generator shall report an error.⌋

7.3 State Management

The state machine of the L-SDU Router module is depicted in Figure 7.2.

[CP_SWS_LSduR_00026]
Status: DRAFT
Upstream requirements: SRS_BSW_00406

⌈Only one instance of the state machine shall exist in the L-SDU Router module.⌋

[CP_SWS_LSduR_00027]
Status: DRAFT
Upstream requirements: SRS_BSW_00406

⌈The L-SDU Router module shall consist of two states, `LSDUR_UNINIT` and `LSDUR_ONLINE` as defined in `LSduR_StateType`⌋

[CP_SWS_LSduR_00028]
Status: DRAFT
Upstream requirements: SRS_BSW_00406

⌈The L-SDU Router module shall be in the state `LSDUR_UNINIT` after power up the L-SDU Router module (i.e. before calling the `LSduR_Init` function).⌋

[CP_SWS_LSduR_00029]
Status: DRAFT
Upstream requirements: SRS_BSW_00406

⌈The L-SDU Router module shall change to the state `LSDUR_ONLINE` when the L-SDU Router has successfully been initialized via the function `LSduR_Init`⌋

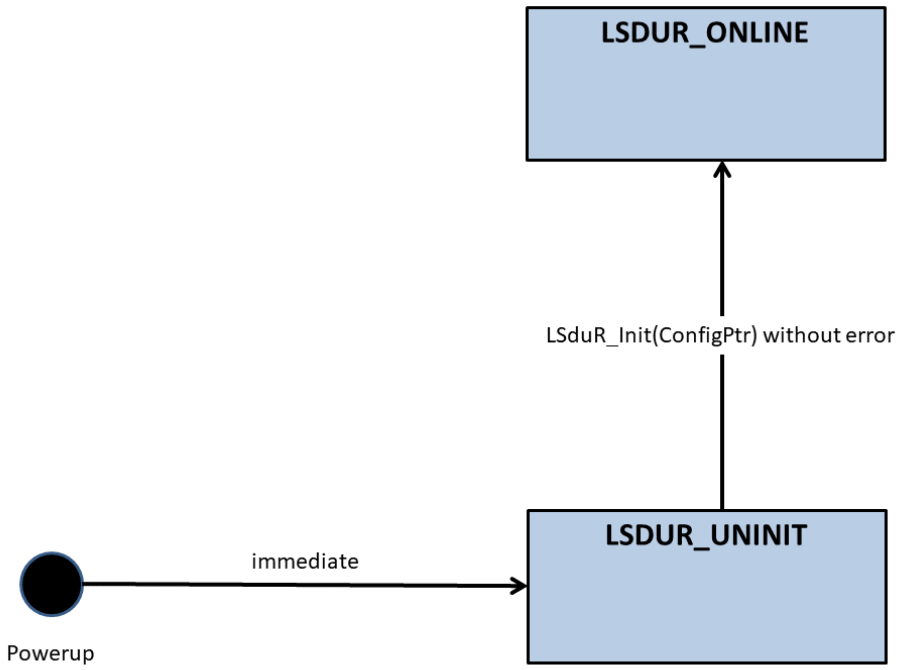

Figure 7.2: L-SDU Router states

[CP_SWS_LSduR_00030]
Status: DRAFT
Upstream requirements: SRS_BSW_00406, SRS_GTW_06141

⌈The L-SDU Router module shall perform routing of L-SDUs according to the L-SDU Router routing tables only when it is in the online state `LSDUR_ONLINE`⌋

[CP_SWS_LSduR_00031]
Status: DRAFT
Upstream requirements: SRS_BSW_00406, SRS_GTW_06001

⌈The L-SDU Router module shall perform no routing when it is in the uninitialized state `LSDUR_UNINIT`⌋

[CP_SWS_LSduR_00032]
Status: DRAFT
Upstream requirements: SRS_BSW_00406

⌈If the L-SDU Router module has not been initialized (state `LSDUR_UNINIT` all functions except `LSduR_Init` and `LSduR_GetVersionInfo` shall report the error `LSDUR_E_UNINIT` via the DET when called, when `LSduRDevErrorDetect` is enabled.⌋

7.4 Complex Driver Interaction

Besides the modules of the Communication Service layer (e.g. IEEE1722Tp module) and the modules of the Hardware Abstraction layer (e.g. EthIf module), Complex Drivers (CDD) are also possible as upper or lower layer modules for the LSduR.

Whether a CDD is an upper layer or a lower layer module for the LSduR is configurable via the `LSduRUpperModule` or `LSduRLowerModule` configuration parameters of the `LSduRBswModules` configuration.

A CDD can require Communication Interface API, depending on the configuration parameters `LSduRCommunicationInterface` (e.g. `LSduRTransmit`) of the `LSduRBswModules` configuration. The API functions provided by the LSduR for the CDD interaction contain the CDD's service prefix as specified by the `apiServicePrefix` configuration parameter, see [CP_SWS_LSduR_00033].

The LSduR provides the unique transmit function `LSduR_<Cdd>Transmit` for each upper layer CDD. When a callout function of the LSduR is invoked from a lower layer module for a L-SDU that is transmitted or received by an upper layer CDD, the LSduR invokes the corresponding target function of the CDD.

For a lower layer CDD that requires a Communication Interface API, the LSduR provides a unique set of Communication Interface API functions `LSduR_<Cdd>RxIndication` and - if configured - `LSduR_<Cdd>TxConfirmation` and `LSduR_<Cdd>TriggerTransmit`, see Section 8.3.3.

When an API function of the LSduR is invoked from an upper layer module for a L-SDU that is transmitted or received by a lower layer CDD, the L-SduR invokes the corresponding target function of the CDD.

To determine if a L-SDU is transmitted or received by a CDD, the LSduR has to examine the origin of the references to the PDU list in the EcuC module:

- If the source L-SDU of a routing path references a PDU in the PDU list that is also referenced by an upper layer CDD, the L-SDU is transmitted by the CDD.
- If the destination L-SDU of a routing path references a PDU in the PDU list that is also referenced by an upper layer CDD, the L-SDU is received by the CDD.
- If the source L-SDU of a routing path references a PDU in the PDU list that is also referenced by a lower layer CDD, the L-SDU is received from the CDD.
- If the destination L-SDU of a routing path references a PDU in the PDU list that is also referenced by a lower layer CDD, the L-SDU is transmitted via the CDD.

[CP_SWS_LSduR_00033]

Status: DRAFT
Upstream requirements: SRS_BSW_00310

⌈The LSduR shall use the `apiServicePrefix` attribute of the CDD's vendor specific module definition (`EcucModuleDef` element) to replace the `<Lo>` and `<Up>` tags of

the GenericComServices APIs. The CDD's vendor specific module definition can be indirectly accessed via the configuration parameter LSduRBswModuleRef which references the top-level element of the concrete configuration of the CDD (i.e., Ecuc ModuleConfigurationValues element) which references the CDD's vendor specific module definition (EcucModuleDef element).⌋

7.5 Security Events

The module does not report security events.

7.6 Multicore Distribution

The L-SDU Router module, in collaboration with the PDU Router module, is distributed over all partitions and acts as a central inter-partition dispatcher for any inter-partition (inter-core) routing path(s), mainly for gateway and multicast use cases.

For further explanations about the distribution principles, please see chapter "Com-Stack Distribution" within the [7, Guide to BSW Distribution].

[CP_SWS_LSduR_00044] L-SDU Router module configuration generation consider the partition assignment

Status: DRAFT

⌈The L-SDU Router module configuration generator shall examine the partition assignment of each source/destination L-SDU of all routing path instances. The L-SDU Router module configuration generator shall consider the PDU Router module configuration to support an optimized multicore routing implementation.⌋

Note: The generation of L-SDU Router and PDU Router module could result in one module, since both modules provide nearly the same functionality

[CP_SWS_LSduR_00045] L-SDU Router module configuration generation consider dedicated partition references

Status: DRAFT

⌈The L-SDU Router module configuration generator shall take over the dedicated partition reference if an EcucPduDedicatedPartition container is available for the respective module, referred by EcucPduDedicatedPartitionBswModuleRef.⌋

[CP_SWS_LSduR_00046] Utilization of a default partition reference

Status: DRAFT

⌈In case no module individual dedicated partition reference (`EcucPduDedicatedPartition`) is available for the respective module, the L-SDU Router module configuration generator shall take over the default partition reference of the L-SDU.⌋

[CP_SWS_LSduR_00047] Determine intra-partition communication

Status: DRAFT

⌈The L-SDU Router module configuration generator shall process a routing path as intra-partition communication, if both connected L-SDUs (source and target) are assigned to the same partition.⌋

[CP_SWS_LSduR_00048] Determine inter-partition communication

Status: DRAFT

⌈The L-SDU Router module configuration generator shall process a routing path as inter-partition communication, if the connected source and target L-SDU are assigned to different partitions.⌋

[CP_SWS_LSduR_00049] Generation of init function per ECUC partition

Status: DRAFT
Upstream requirements: SRS_BSW_00459, SRS_BSW_00460

⌈In configurations, in which upper and/or lower layers reside in different partitions, the L-SDU Router module configuration generator shall provide the possibility to generate one init function per ECUC partition.⌋

[CP_SWS_LSduR_00050] Determine support of L-SDU routing path groups

Status: DRAFT

⌈The L-SDU Router shall only accept LSduRRoutingPathGroups, which contain `LSduRPath`s having all destination L-SDUs assigned to the same partition.⌋

7.6.1 Intra-partition Routing Path

The intra-partition communication behavior should not be altered, even though there are upper and/or lower layers, which reside in different partitions.

[SWS_LSduR_CONSTR_00001] Support of trigger transmit for intra-partion routings

Status: DRAFT

⌈For routing paths with TriggerTransmit Transmission from an upper layer module the L-SDU Router shall accept intra-partition routings only.⌋

7.6.2 Inter-partition Routing Path

This chapter describes, how the L-SDU Router module shall handle inter-partition routing paths. This means a destination PDU is mapped to a different ECUC partition than the corresponding source Pdu.

The LSduR need to perform the actual cross-partition communication with respect to data and call context.

Note: The [7, Guide to BSW Distribution] describes the ways how to solve a context switch in a multicore environment within its chapter "BSW Distribution in Multi-Core Systems".

7.6.2.1 Upper layer module interaction

[CP_SWS_LSduR_00051] Interpretation of return value for transmission via interpartion routing paths

Status: DRAFT

⌈For inter-partition routing paths, the return value of the function `LSduR_<User:Up>Transmit` shall reflect if the L-SDU Router module itself has accepted the transmit request or not.⌋

[CP_SWS_LSduR_00052] Execution of code per ECUC partition for transmission via inter-partion routing paths

Status: DRAFT

⌈For inter-partition routing paths, the call to the function `LSduR_<User:Up>Transmit` shall only execute code that is assigned to the same ECUC partition. The L-SDU Router module shall not call the `<Provider:Lo>_Transmit` in the call context of `LSduR_<User:Up>Transmit`. The L-SDU Router module shall call `<Provider:Lo>_Transmit` in the ECUC partition context of the `<Provider:Lo>` module (in fact of the ECUC partition defined via the `EcucPduDefaultPartitionRef` or the `EcucPduDedicatedPartitionRef` of the `LSduRPathDestinationPduRef`).⌋

[CP_SWS_LSduR_00053] Execution of code per ECUC partition for release reception buffer via inter-partion routing paths

Status: DRAFT

⌈For inter-partition routing paths, the call to the function LSduR_<User:Up>ReleaseRxBuffer shall only execute code that is assigned to the same ECUC partition. The L-SDU Router module shall not call the <Provider:Lo>_ReleaseRxBuffer in the call context of LSduR_<User:Up>ReleaseRxBuffer. The L-SDU Router module shall call <Provider:Lo>_ReleaseRxBuffer in the ECUC partition context of the <Provider:Lo> module (in fact of the ECUC partition defined via the EcucPduDefaultPartitionRef or the EcucPduDedicatedPartitionRef of the LSduRPathDestinationPduRef).⌋

7.6.2.2 Lower layer Communication Interface module interaction

[CP_SWS_LSduR_00054] Execution of code per ECUC partition for reception via inter-partion routing paths

Status: DRAFT

⌈For inter-partition routing paths, the call to the function LSduR_<User:Lo>RxIndication shall only execute code that is assigned to the same ECUC partition. The L-SDU Router module shall not call the <Provider:Up>_RxIndication in the call context of LSduR_<User:Lo>RxIndication. L-SDU Router module shall call <Provider:Up>_RxIndication in the ECUC partition context of the <Provider:Up> module (in fact of the ECUC partition context defined via the EcucPduDefaultPartitionRef or the EcucPduDedicatedPartitionRef of the LSduRPathSourcePduRef).⌋

[CP_SWS_LSduR_00055] Execution of code per ECUC partition for transmission confirmation via inter-partion routing paths

Status: DRAFT

⌈For inter-partition routing paths, the call to the function LSduR_<User:Lo>TxConfirmation shall only execute code that is assigned to the same ECUC partition. The L-SDU Router module shall not call the <Provider:Up>_TxConfirmation in the call context of PduR_<User:Lo>TxConfirmation. The L-SDU Router module shall call <Provider:Up>_TxConfirmation in the ECUC partition context of the <Provider:Up> module (in fact of the ECUC partition context defined via the EcucPduDefaultPartitionRef or the EcucPduDedicatedPartitionRef of the LSduRPathSourcePduRef).⌋

7.6.2.3 Communication Interface Gatewaying

[CP_SWS_LSduR_00056] Execution of code per ECUC partition for transmission, transmission confirmation and reception via an inter-partion routing path of interface gatewaying

Status: DRAFT

⌈For inter-partition routing paths, the call to the following functions shall only execute code that is assigned to the same ECUC partition:

- LSduR_<SrcLo>RxIndication,
- LSduR_<DstLo>TriggerTransmit,
- LSduR_<DstLo>TxConfirmation.

The L-SDU Router module shall not call the <DstLo>_Transmit in the call context of LSduR_<SrcLo>RxIndication. The L-SDU Router module call <DstLo>_Transmit in the ECUC partition context of the <DstLo> module (in fact of the ECUC partition context defined via the EcucPduDefaultPartitionRef or the EcucPduDedicatedPartitionRef of the LSduRPathDestinationPduRef).⌋

7.7 API parameter checking

[CP_SWS_LSduR_00034]

Status: DRAFT
Upstream requirements: SRS_GTW_06142, SRS_BSW_00323

⌈If development error detection is enabled, a PDU identifier is not within the specified range, and the PDU identifier is configured to be used by the L-SDU Router module, the L-SDU Router module shall report the error LSDUR_E_PDU_ID_INVALID to the DET module, when LSduRDevErrorDetect is enabled.⌋

7.8 Error Classification

Section "Error Handling" of the document [2, SWS BSW General] "General Specification of Basic Software Modules" describes the error handling of the Basic Software in detail. Above all, it constitutes a classification scheme consisting of five error types which may occur in BSW modules.

Based on this foundation, the following section specifies particular errors arranged in the respective subsections below.

7.8.1 Development Errors

[CP_SWS_LSduR_91001] Definiton of development errors in module LSduR

Status: DRAFT
Upstream requirements: SRS_BSW_00337, SRS_BSW_00323, SRS_BSW_00452

⌈

Type of error	*Related error code*	*Error value*
Invalid configuration pointer	LSDUR_E_INIT_FAILED	0x00
API service (except LSduR_GetVersionInfo) used without module initialization or LSduR_Init called in any state other than LSDUR_UNINIT	LSDUR_E_UNINIT	0x01
Invalid PDU identifier	LSDUR_E_PDU_ID_INVALID	0x02
Null pointer has been passed as an argument	LSDUR_E_PARAM_POINTER	0x03

⌋

7.8.2 Runtime Errors

[CP_SWS_LSduR_91002] Definiton of runtime errors in module LSduR

Status: DRAFT

⌈

Type of error	*Related error code*	*Error value*
Loss of a PDU instance (buffer overrun in gateway operation)	LSDUR_E_PDU_INSTANCES_LOST	0x04

⌋

7.8.3 Production Errors

The IEEE1722Tp module does not define production errors.

7.8.4 Extended Production Errors

The LSduR module does not define extended production errors.

8 API specification

8.1 Imported types

In this chapter all types included from the following files are listed.

[CP_SWS_LSduR_91017] Definition of imported datatypes of module LSduR ⌈

Module	*Header File*	*Imported Type*
Comtype	ComStack_Types.h	PduIdType
	ComStack_Types.h	PduInfoType
	ComStack_Types.h	PduLengthType
Std	Std_Types.h	Std_ReturnType
	Std_Types.h	Std_VersionInfoType

⌋

8.2 Type definitions

8.2.1 LSduR_PBConfigType

The post-build-time configuration fulfills two functionalities:

- Post-build selectable, where more than one configuration is located in the ECU, and one is selected at init of the L-SDU Router module
- Post-build loadable, where one configuration is located in the ECU. This configuration may be reprogrammed after compile-time

Basically there is no restriction to mix both selectable and loadable. Typically the post-build loadable is located in its own flash sector where it can be reprogrammed without affecting other modules/applications.

[CP_SWS_LSduR_91003] Definition of datatype LSduR_PBConfigType

Status: DRAFT
Upstream requirements: SRS_BSW_00400, SRS_BSW_00438, SRS_BSW_00404, SRS_BSW_00305

[CP_SWS_LSduR_00035]
Status: DRAFT
Upstream requirements: SRS_BSW_00438, SRS_BSW_00404

⌈The type `LSduR_PBConfigType` is an external data structure containing post-build-time configuration data of the L-SDU Router module which shall be implemented in LSduR_PBcfg.c.⌋

Note: see chapter Section 5.1

8.2.2 LSduR_PBConfigIdType

This type is returned by the `LSduR_GetConfigurationId` API.

[CP_SWS_LSduR_91004] Definition of datatype LSduR_PBConfigIdType
Status: DRAFT
Upstream requirements: SRS_BSW_00405, SRS_BSW_00305, SRS_GTW_06097

⌈

Name	LSduR_PBConfigIdType (draft)
Kind	Type
Derived from	uint16
Description	Identification of the post-build configuration currently used for routing L-SDUs. An ECU may contain several configurations (post-build selectable), each have unique Id. **Tags:** atp.Status=draft
Available via	LSduR.h

⌋

8.2.3 LSduR_StateType

This type is returned by the `LSduR_GetConfigurationId` API.

[CP_SWS_LSduR_91005] Definition of datatype LSduR_StateType

Status: DRAFT
Upstream requirements: SRS_BSW_00305, SRS_BSW_00335, SRS_BSW_00406

⌈

Name	LSduR_StateType (draft)		
Kind	Enumeration		
Range	LSDUR_UNINIT	–	L-SDU Router not initialized
	LSDUR_ONLINE	–	L-SDU Router initialized successfully
Description	States of the L-SDU Router **Tags:** atp.Status=draft		
Available via	LSduR.h		

⌋

8.3 Function definitions

8.3.1 General functions provided by the L-SDU Router

8.3.1.1 LSduR_Init

[CP_SWS_LSduR_91006] Definition of API function LSduR_Init

Status: DRAFT
Upstream requirements: SRS_BSW_00101, SRS_BSW_00358, SRS_BSW_00414, SRS_BSW_-00310

⌈

Service Name	LSduR_Init (draft)	

Syntax	`void LSduR_Init (`
	`  const LSduR_PBConfigType* ConfigPtr`
	`)`	

Service ID [hex]	0x1	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	ConfigPtr	Pointer to post build configuration
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	Initializes the L-SDU Router **Tags:** atp.Status=draft	
Available via	LSduR.h	

⌋

Integration note: To avoid problems calling the PDU Router module uninitialized it is important that the PDU Router module is initialized before interfaced modules.
Note: NULL pointer checking is specified within document [2, SWS BSW General].

8.3.1.2 LSduR_GetVersionInfo

[CP_SWS_LSduR_91007] Definition of API function LSduR_GetVersionInfo

Status: DRAFT

8.3.2 Configurable interfaces definitions for interaction with upper layer module

8.3.2.1 LSduR_<User:Up>Transmit

[CP_SWS_LSduR_91009] Definition of API function LSduR_<User:Up>Transmit

Status: DRAFT
Upstream requirements: SRS_GTW_06144, SRS_GTW_06145, SRS_BSW_00310

⌈

Service Name	LSduR_<User:Up>Transmit (draft)	

Syntax	`Std_ReturnType LSduR_<User:Up>Transmit (`
	`  PduIdType TxPduId,`
	`  const PduInfoType* PduInfoPtr`
	`)`	

Service ID [hex]	0x49	
Sync/Async	Synchronous	
Reentrancy	Reentrant for different PduIds. Non reentrant for the same PduId.	
Parameters (in)	TxPduId	Identifier of the PDU to be transmitted
	PduInfoPtr	Length of and pointer to the PDU data and pointer to MetaData.
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	`E_OK`: Transmit request has been accepted. `E_NOT_OK`: Transmit request has not been accepted.

▽

△

Description	Requests transmission of a PDU. **Tags:** atp.Status=draft
Available via	LSduR_<module>.h

⌋

8.3.2.2 LSduR_<User:Up>CancelTransmit

[CP_SWS_LSduR_91020] Definition of API function LSduR_<User:Up>CancelTransmit

Status: DRAFT

⌈

Service Name	LSduR_<User:Up>CancelTransmit (draft)	
Syntax	`Std_ReturnType LSduR_<User:Up>CancelTransmit ( PduIdType TxPduId )`	
Service ID [hex]	0x4a	
Sync/Async	Synchronous	
Reentrancy	Reentrant for different PduIds. Non reentrant for the same PduId.	
Parameters (in)	TxPduId	Identification of the PDU to be cancelled.
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	`E_OK`: Cancellation was executed successfully by the destination module. `E_NOT_OK`: Cancellation was rejected by the destination module.
Description	Requests cancellation of an ongoing transmission of a PDU in a lower layer communication module. **Tags:** atp.Status=draft	
Available via		

⌋

8.3.2.3 LSduR_<User:Up>ReleaseRxBuffer

[CP_SWS_LSduR_91012] Definition of API function LSduR_<User:Up>ReleaseRxBuffer

Status: DRAFT
Upstream requirements: SRS_GTW_06144, SRS_GTW_06145, SRS_BSW_00310

⌈

Service Name	LSduR_<User:Up>ReleaseRxBuffer (draft)	
Syntax	`void LSduR_<User:Up>ReleaseRxBuffer ( PduIdType RxPduId )`	
Service ID [hex]	0x7	
Sync/Async	Synchronous	
Reentrancy	Reentrant for different PduIds. Non reentrant for the same PduId	
Parameters (in)	RxPduId	Identifier of the received PDU.
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	Indication from the upper layer to release the lower layer reception buffer. **Tags:** atp.Status=draft	
Available via	LSduR_<module>.h	

⌋

8.3.3 Configurable interfaces definitions for lower layer communication interface module interaction

Since the API description now has a generic approach, the `serviceId`s of the lower layer API functions are generic as well. To differentiate between several lower layers, the LSduR uses the `moduleId`s of the lower layer modules as the `instanceId` argument in the Det call originated from APIs listed in this section.

8.3.3.1 LSduR_<User:Lo>RxIndication

[CP_SWS_LSduR_91011] Definition of callback function LSduR_<User:Lo>RxIndication

Status: DRAFT
Upstream requirements: SRS_GTW_06144, SRS_GTW_06145, SRS_BSW_00310

⌈

Service Name	LSduR_<User:Lo>RxIndication (draft)	

Syntax	`void LSduR_<User:Lo>RxIndication (`
	`  PduIdType RxPduId,`
	`  const PduInfoType* PduInfoPtr`
	`)`	

Service ID [hex]	0x42	
Sync/Async	Synchronous	
Reentrancy	Reentrant for different PduIds. Non reentrant for the same PduId.	
Parameters (in)	RxPduId	ID of the received PDU.
	PduInfoPtr	Contains the length (SduLength) of the received PDU, a pointer to a buffer (SduDataPtr) containing the PDU, and the MetaData related to this PDU.
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	Indication of a received PDU from a lower layer communication interface module. **Tags:** atp.Status=draft	
Available via	LSduR_<module>.h	

⌋

8.3.3.2 LSduR_<User:Lo>TxConfirmation

[CP_SWS_LSduR_91013] Definition of callback function LSduR_<User:Lo>TxConfirmation

Status: DRAFT
Upstream requirements: SRS_GTW_06144, SRS_GTW_06145, SRS_BSW_00310

⌈

Service Name	LSduR_<User:Lo>TxConfirmation (draft)

Syntax	`void LSduR_<User:Lo>TxConfirmation (`
	`  PduIdType TxPduId,`
	`  Std_ReturnType result`
	`)`

Service ID [hex]	0x40
Sync/Async	Synchronous
Reentrancy	Reentrant for different PduIds. Non reentrant for the same PduId.

▽

△

Parameters (in)	TxPduId	ID of the PDU that has been transmitted.
	result	E_OK: The PDU was transmitted. E_NOT_OK: Transmission of the PDU failed.
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	The lower layer communication interface module confirms the transmission of a PDU, or the failure to transmit a PDU. **Tags:** atp.Status=draft	
Available via	LSduR_<module>.h	

⌋

8.3.3.3 LSduR_<User:Lo>TriggerTransmit

[CP_SWS_LSduR_91014] Definition of callback function LSduR_<User:Lo>TriggerTransmit

Status: DRAFT
Upstream requirements: SRS_GTW_06144, SRS_GTW_06145, SRS_BSW_00310

⌈

Service Name	LSduR_<User:Lo>TriggerTransmit (draft)	
Syntax	`Std_ReturnType LSduR_<User:Lo>TriggerTransmit ( PduIdType TxPduId, PduInfoType* PduInfoPtr )`	
Service ID [hex]	0x41	
Sync/Async	Synchronous	
Reentrancy	Reentrant for different PduIds. Non reentrant for the same PduId.	
Parameters (in)	TxPduId	ID of the SDU that is requested to be transmitted.
Parameters (inout)	PduInfoPtr	Contains a pointer to a buffer (SduDataPtr) to where the SDU data shall be copied, and the available buffer size in SduLengh. On return, the service will indicate the length of the copied SDU data in SduLength.
Parameters (out)	None	
Return value	Std_ReturnType	`E_OK`: SDU has been copied and SduLength indicates the number of copied bytes. `E_NOT_OK`: No SDU data has been copied. PduInfoPtr must not be used since it may contain a NULL pointer or point to invalid data.
Description	Within this API, the upper layer module (called module) shall check whether the available data fits into the buffer size reported by PduInfoPtr->SduLength. If it fits, it shall copy its data into the buffer provided by PduInfoPtr->SduDataPtr and update the length of the actual copied data in PduInfoPtr->SduLength. If not, it returns E_NOT_OK without changing PduInfoPtr. **Tags:** atp.Status=draft	
Available via	LSduR_<module>.h	

⌋

8.4 Callback notifications

There are no callback notifications defined.

8.5 Scheduled functions

As any L-SDU Router operation is triggered by an adjacent communication module the L-SDU Router does not require scheduled functions.

8.6 Expected interfaces

In this chapter all interfaces required from other modules are listed.

The L-SDU router module is modeled as a generic module that can interface to different upper and lower modules. The approach taken to model this generic approach is to have a virtual module called `GenericComServices`. This virtual module contains a set of APIs that the L-SDU router will call in upper layer or lower layer modules. These APIs are generic in the way that they contain a tag `<Lo>` and `<Up>` that is replaced with the interfaced module. The tag is set by the configuration in the `LSduRBswModules` container using the `LSduRBswModuleRef` reference parameter.

8.6.1 Mandatory interfaces

The L-SDU Router does not require mandatory interfaces. The required API functions depend on the configuration.

[CP_SWS_LSduR_91015] Definition of mandatory interfaces required by module LSduR

Upstream requirements: SRS_BSW_00384

⌈

API Function	*Header File*	*Description*
Det_ReportRuntimeError	Det.h	Service to report runtime errors. If a callout has been configured then this callout shall be called.

⌋

8.6.2 Optional interfaces

This section defines all interfaces, which are required to fulfill an optional functionality of the module.

[CP_SWS_LSduR_91016] Definition of optional interfaces requested by module LSduR

Upstream requirements: SRS_BSW_00384

⌈

API Function	*Header File*	*Description*
<Provider:Lo>_ReleaseRxBuffer	LSduR_<module>.h	Indication from the upper layer to release the lower layer reception buffer.
<Provider:Lo>_Transmit	–	Requests transmission of a PDU.
<Provider:Up>_RxIndication	–	Indication of a received PDU from a lower layer communication interface module.
<Provider:Up>_TriggerTransmit	–	Within this API, the upper layer module (called module) shall check whether the available data fits into the buffer size reported by PduInfoPtr->SduLength. If it fits, it shall copy its data into the buffer provided by PduInfoPtr->SduDataPtr and update the length of the actual copied data in PduInfoPtr->SduLength. If not, it returns E_NOT_OK without changing PduInfoPtr.
<Provider:Up>_TxConfirmation	–	The lower layer communication interface module confirms the transmission of a PDU, or the failure to transmit a PDU.

⌋

8.7 Service Interfaces

There are no service interfaces defined.

9 Sequence diagrams

The goal of this chapter is to make the understanding of the PDU Router easier. For this purpose sequence diagrams which show different communication scenarios are used. Please consider that the sequence diagrams are not exhaustive and are only used to support the functional specification (Chapter 7) and API specification (Chapter 8)

Focus of the sequence diagrams is the L-SDU Router and therefore interactions between other modules (e.g. between an interface and its driver) are not shown.

Note: The diagrams in this chapter show specific use-cases. They do not reflect requirements for an implementation of the L-SDU Router module.

9.1 L-SDU transmission

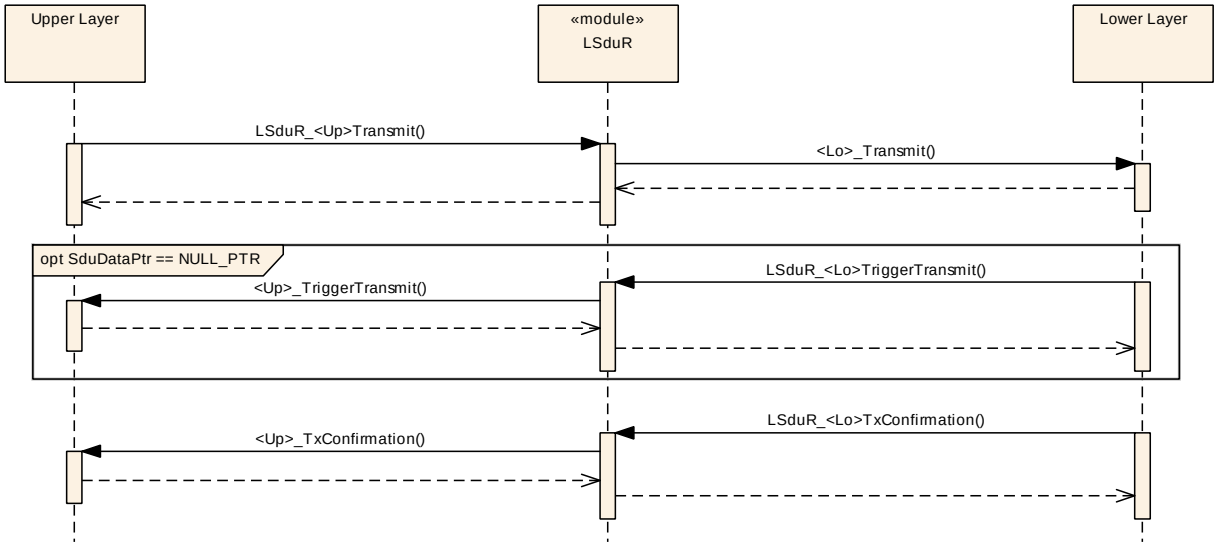

Figure 9.1: L-SDU transmission

9.2 L-SDU reception

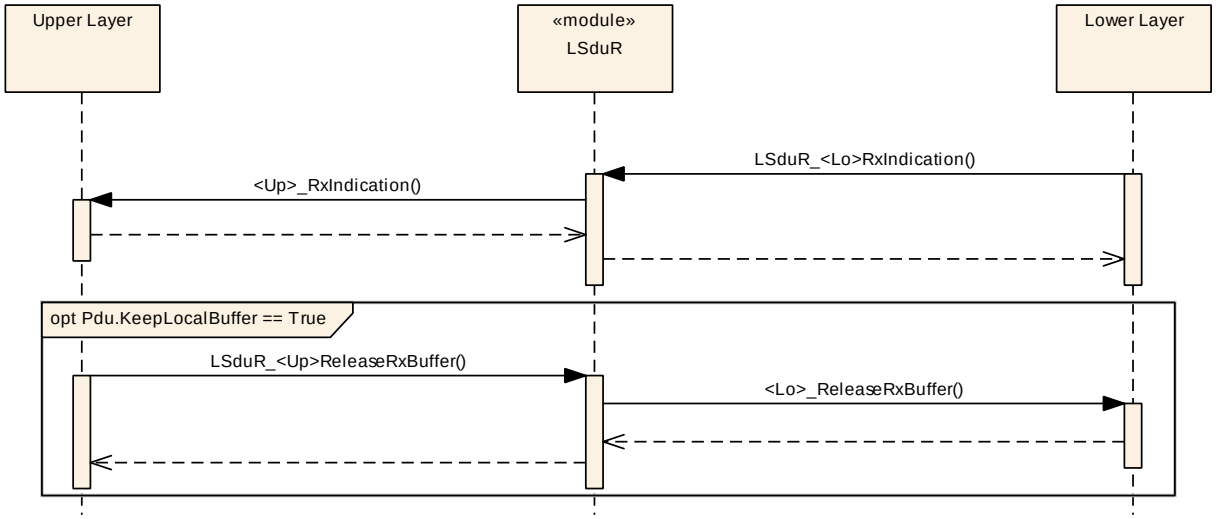

Figure 9.2: L-SDU reception

10 Configuration specification

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification Chapter 10.1 describes fundamentals. It also specifies a template (table) you shall use for the parameter specification. We intend to leave Chapter 10.1 in the specification to guarantee comprehension.

Chapter 10.2 specifies the structure (containers) and the parameters of the module LSduR.

Chapter 10.3 specifies published information of the module LSduR.

10.1 How to read this chapter

For details refer to the chapter 10.1 “Introduction to configuration specification” in SWS_BSWGeneral.

10.1.1 Variants

[CP_SWS_LSduR_00037]
Status: DRAFT
Upstream requirements: SRS_GTW_06002, SRS_BSW_00404

⌈The L-SDU Router module shall support the update of the routing configuration (i.e. the L-SDU Router routing tables) at post build-time if this variant is supported.⌋

Support of post-build update of the routing table is not always desired. Therefore post-build update of the routing table is only supported in the variant post-build of the L-SDU Router module, see further section 10.1.1.

The post-build comes in two flavors: Selectable and Loadable, there is no restriction on using any of them in the L-SDU Router module or even a combination of them.

[CP_SWS_LSduR_00038]
Status: DRAFT
Upstream requirements: SRS_GTW_06001, SRS_BSW_00404

⌈If the variant post-build is supported, the update of the routing tables shall only be possible when the L-SDU Router module is uninitialized.⌋

Remark: The process how the update of the routing tables is performed is not restricted. Most likely a reflashing of the memory segment that holds the table will be done by the bootloader - a separate program which may be loaded after a reboot to update the ECU.

[CP_SWS_LSduR_00039]

Status: DRAFT

Upstream requirements: SRS_GTW_06097, SRS_BSW_00404

⌈The post-build time configuration of the L-SDU Router module shall be identifiable by the unique configuration identifier: `LSduRConfigurationId`⌋

Remark: The unique configuration identifier is not used to select one of multiple post-build configuration sets of the L-SDU Router module, but for unique identification of the current L-SDU Router module post-build configuration, e.g. for Diagnostics or for checking at runtime that the post-build configurations of related communication modules match. The configuration identifier can be read via the API `LSduR_GetConfigurationId` see section 8.3.1.3.

10.2 Containers and configuration parameters

The following chapters summarize all configuration parameters. The detailed meanings of the parameters describe Chapter 7 and Chapter 8.

10.2.1 LSduR

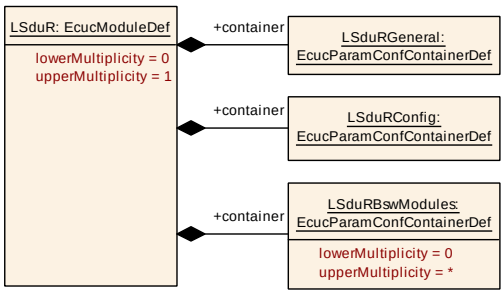

Figure 10.1: LSduR

[ECUC_LSduR_00001] Definition of EcucModuleDef LSduR

Status: DRAFT

⌈

Module Name	LSduR
Description	Configuration of the LSduR module.
Post-Build Variant Support	true
Supported Config Variants	VARIANT-LINK-TIME, VARIANT-POST-BUILD, VARIANT-PRE-COMPILE

Included Containers		
Container Name	**Multiplicity**	**Scope / Dependency**
LSduRBswModules	0..*	Each container describes a specific BSW module (upper/CDD/ lower/IEEE1722Tp) that the L-SDU Router shall interface to. The reason to have it as own configuration container instead of implication of the routing path is to be able to configure CDDs properly and to force modules to be used in a post-build situation even though no routing is made to/from this module (future configurations may include these modules). **Tags:** atp.Status=draft
LSduRConfig	1	This container contains the configuration parameters and sub containers of the AUTOSAR LSduR module. **Tags:** atp.Status=draft
LSduRGeneral	1	Specifies the general configuration parameters of the LSduR. **Tags:** atp.Status=draft

10.2.5 LSduRBswModules

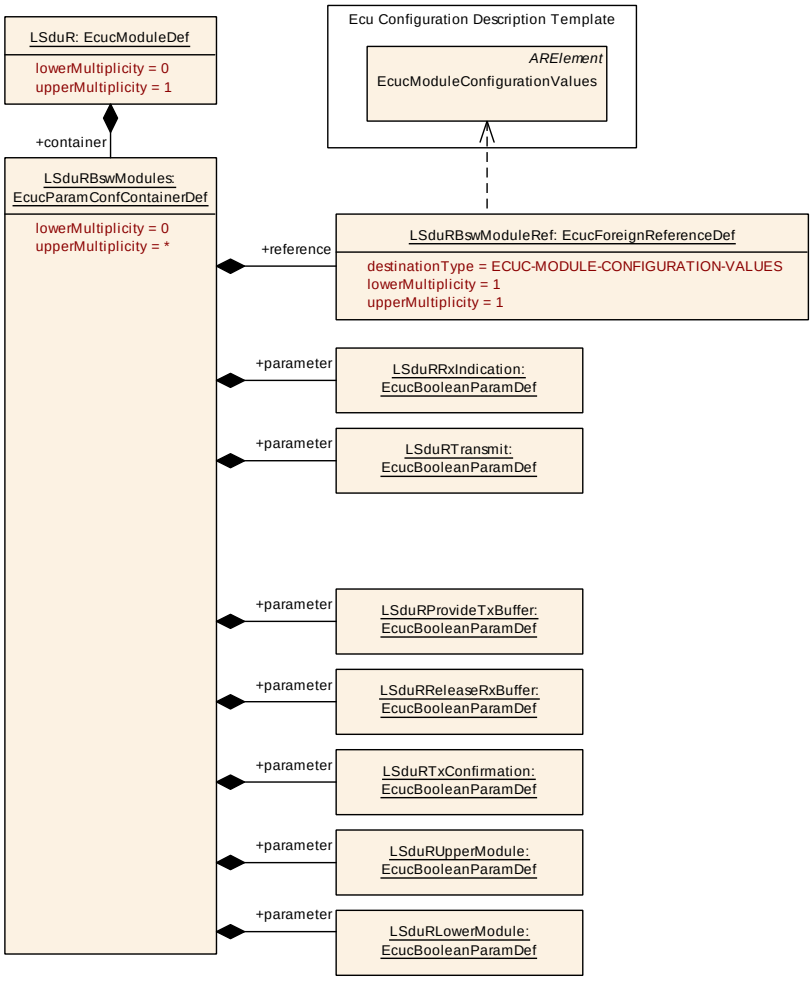

Figure 10.4: LSduRBswModules

[ECUC_LSduR_00015] Definition of EcucParamConfContainerDef LSduRBsw Modules

Status: DRAFT

⌈

Container Name	LSduRBswModules
Parent Container	LSduR
Description	Each container describes a specific BSW module (upper/CDD/lower/IEEE1722Tp) that the L-SDU Router shall interface to. The reason to have it as own configuration container instead of implication of the routing path is to be able to configure CDDs properly and to force modules to be used in a post-build situation even though no routing is made to/from this module (future configurations may include these modules). **Tags:** atp.Status=draft
Post-Build Variant Multiplicity	false

▽

△

Multiplicity Configuration Class	**Pre-compile time**	X	VARIANT-PRE-COMPILE, VARIANT-POST-BUILD

⌋

[ECUC_LSduR_00024] Definition of EcucBooleanParamDef LSduRLowerModule

Status: DRAFT

⌈

Parameter Name	LSduRLowerModule		
Parent Container	LSduRBswModules		
Description	The LSduRLowerModule will decide who will call the APIs and who will implement the APIs. For example, if the EthIf module is referenced then the L-SDU Router module will implement the LSduR_EthIfRxIndication API and the L-SDU Router module will call the EthIf_Transmit API. Other APIs are of course also covered. An upper module can also be an lower module (e.g. the IEEE1722Tp module). **Tags:** atp.Status=draft		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default value	–		
Post-Build Variant Value	false		
Value Configuration Class	**Pre-compile time**	X	All Variants
	Link time	–	
	Post-build time	–	
Scope / Dependency	scope: ECU		

⌋

[ECUC_LSduR_00019] Definition of EcucBooleanParamDef LSduRProvideTx Buffer

Status: DRAFT

⌈

Parameter Name	LSduRProvideTxBuffer		
Parent Container	LSduRBswModules		
Description	Specifies if BSW module supports the (IF) ProvideTxBuffer API or not. Value true the API is supported. **Tags:** atp.Status=draft		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default value	–		
Post-Build Variant Value	false
