7	Revision History	of the Release 3.0	 	21

AUTOSAR

1 Scope of this Document

This document provides an overview of the complement of AUTOSAR deliverables comprising the Release 3.0 in its latest Revision 7. Further a history is provided aimed to identify the changes between the individual revisions within Release 3.0. This document also contains a compilation of known technical deficiencies and their relation to specific documents.

1.1 Technical Overview

A technical overview on the technical concepts behind the AUTOSAR Standard is provided in [2].

1.2 Document Overview

This document is structured as follows:

Chapter 2 provides a list of documentation references.

Chapter 3 provides a set of definitions aimed to increase the understanding of the content of this document and the Release 3.0.

Chapter 4 provides a summary of changes that were implemented since the preceding Release 2.1.

Chapter 5 states the Release's 3.0 validity status and contains the overview of deliverables comprising the Release 3.0 in its latest Revision 7. This chapter is structured according to the clusters being in use in AUTOSAR Release 3.0.

Chapter 6 contains a compilation of known technical deficiencies and their relation to specific documents.

Chapter 7 contains the detailed Revision History.

- [5] Definition of Change Management Process AUTOSAR_DS_ChangeManagementProcess.pdf

3 Definitions

As far as not explained in this chapter, a collection of AUTOSAR definitions is provided in the Glossary [1].

3.1 Release Number

AUTOSAR applies a two-digit numbering scheme Rx.y to identify releases. Refering to [4], its primary purpose is to identify a release as a major (upgrade) or as minor (update) release. Refering to previous releases (e.g. R2.0), incrementing the first digit "x" does identify a release as major, whereas incrementing "y" will mark a release as only minor by nature.

3.2 Revision Number

The Revision Number was first time introduced with Release 2.1 and extends the Release Numbering scheme as explained in section 3.1. Combined with the Release Number, the Revision Number shall:

- 1) Precisely identify the actual content (set of deliverables) of a given release,
- 2) As depicted in every deliverable, precisely identify a given deliverable (with its unique name and three-digit version ID) as being part of the release (here: Release 3.0)

Item 1) addresses the fact that the set of deliverables comprising a release (in the meaning of a baseline) is rarely established once at a certain point in time ("Big Bang"), but rather evolves and/or varies over a certain timeframe the maximum duration of which is limited by the timeframe a release is declared as "valid" by the AUTOSAR Partnership (see section 3.3).

Hence with Item 1), a major prerequisite will be put in place to enable the Standard Maintenance as planned by the AUTOSAR Partnership. In general, the primary objective is to avoid the provision of an additional – previously not planned – release in case only one or a few deliverables were to be modified as part of the Standard Maintenance. Conversely, without the application of a Revision Number, if the AUTOSAR partnership wants to avoid the provision of (an) additional intermediate release(s), one would have to defer the introduction of any changes until the next planned release.— even in case of changes urgently needed by the applicants of the AUTOSAR Standard.

Item 2) is complementary to Item 1) in that for every deliverable a unique identifier is provided upon which revision a) a deliverable was either 1st time added to/removed from a release or b) a deliverable was modified as being part of one and the same release, as long the latter is valid and therefore subject to Standard Maintenance.

Hence with item 2), the combination of Release and Revision Number in a document can be interpreted either as a) "deliverable was $(1^{st}$ time) added to the Release x.y Rev n" or b) as "deliverable was modified as part of Release x.y Rev m", with m > n.

Release 3.0 Rev 7

Conversely, the revision number will only change for deliverables subject to addition or modification of a valid release (baseline). After their 1st time addition to the release (baseline), it will not change for deliverables which are not modified.

In the light of the above provided background, as an additional remark, the Revision Number will only be applied for each deliverable's release version, i.e. it will not be applied to working versions.

3.3 Release Validity Status

According to the Release Management Process Definition [4], each release (baseline) can enter one of the three consecutive steps within its lifecycle:

- 1. CURRENT: The latest release. A CURRENT release is by default VALID.
- 2. VALID: a release preceding the CURRENT release. A VALID release is subject to Standard Maintenance, the procedures of which are defined by a Change Management Process Definition [5].
- 3. OBSOLETE: a release preceding the VALID and/or CURRENT release for which, however, no Standard Maintenance is provided anymore.

3.4 Standard Specifications

Standard Specifications are documents, models or formats which comprise the main result of the AUTOSAR Partnership. It includes the standardized results which have to be fulfilled to achieve AUTOSAR conformance. Standard Specifications are the base for AUTOSAR conformance tests.

In Release 3.0, Standard Specifications are stored at the following URLs: https://svn3.autosar.org/repos2/work/22 Releases/30 Release3.0/01 Standard

3.5 Auxiliary Material

Auxiliary Material is a supporting document, model or format meant to further explain and/or improve the usability of standard specifications of the AUTOSAR partnership. Auxiliary material is recommended to read and/or use for a better understanding or harmonized usage of the AUTOSAR standard but is not mandatory to follow for AUTOSAR conformance.

In Release 3.0, Auxiliary Material is stored at the following URLs: https://svn3.autosar.org/repos2/work/22 Releases/30 Release3.0/02 Auxiliary

3.6 Main Documents

"Main Documents" are general AUTOSAR documents facilitating a global view on requirements, concepts and terms.

3.7 Basic Software Architecture and Runtime Environment

Documents belonging to this release cluster provide descriptions, requirements and specifications of the AUTOSAR Software Architecture and the Runtime Environment.

3.8 Methodology and Templates

Documents belonging to this release cluster provide requirements, specifications, templates and guidelines on the AUTOSAR methodology and tool chain.

3.9 Application Interfaces

Documents belonging to this release cluster provide specifications of interfaces between applications and related explanatory material.

3.10 Other Documents

This cluster contains documents which do not belong to any of the previous release clusters.

3.11 Document status "Final"

Deliverables to which the status "final" was assigned underwent both the planned amount of modifications (either as part of the current or a preceding release) and received the related approvals by the AUTOSAR Core Partners.

3.12 Document status "Draft"

For deliverables to which the status "draft" was assigned either only parts of the planned modifications were undertaken and/or the necessary steps to finalize a document are not yet in place.

In case one has to expect limitations resulting from the application of draft documents, explanations of technical deficiencies are provided in chapter 6.

4 Release 3.0 – Summary of Changes

This chapter contains a summary of changes which were implemented since the previous Release 2.1.

4.1 Cluster: Basic Software Architecture and Runtime Environment

For the Basic Software Modules, the concept for Wake-up of ECUs and Start-up of networks was harmonized.

Three new modules were introduced into the Basic Software Architecture:

- CAN State Manager,
- FlexRay State Manager
- LIN State Manager.

The module Generic Network Management Interface was enhanced by a Network Management Gateway feature.

Most of the Basic Software Module specifications were modified such that they are now linked to the Basic Software UML Model and the Meta Model, respectively.

The Specification of CAN Generic Network Management was removed from the set of deliverables for this Release 3.0 due to obsolescence: This specification was merged with the Specification of CAN Network Management.

4.2 Cluster: Methodology and Templates

The Specification of a Basic Software Module Description Template was introduced as a new deliverable.

The Meta Model and the related template specifications were continuously improved.

The Specification of the System Template was aligned with the Specification of the ECU Configuration Parameters. Initial steps were made to harmonize the System Template with the FIBEX 2.0 Standard.

The UML 2.0 profile document was removed from the set of deliverables for this specific Release 3.0 due to obsolescence.

The Specification of ECU Configuration Parameters was removed from the set of deliverables for this Release 3.0: The content of this specification is now part of the following deliverables:

- Specification of ECU Configuration
- Specification of ECU Configuration Parameters (XML)

4.3 Cluster: Application Interfaces

The Integrated Master Table is released for the first time containing a dictionary of data types and units.

Explanatory documents are first time released for the domains:

- Body and Comfort,
- Powertrain,
- Chassis

As a preparatory step for future releases, a Modeling Guide for Application Interfaces and a related requirements document are first time released.

The standardized Application Interfaces are available as three XML specifications with each of it referring to the XML Schemas of Release 2.0, Release 2.1 and Release 3.0, respectively.

4.4 Cluster: Other Documents

Process documents related to the maintenance of the Standard (see [3] to [5]) were removed from this Release R3.0:

- Definition of Release Management Process
- Requirements on Standard Maintenance
- Definition of Change Management Process

The set of process documents which is related to the accreditation of Conformance Test Agencies was enhanced by the following documents:

- Requirements for CTA Accreditation Bodies
- AUTOSAR CTA Accreditation application rules for ISO Guide 65
- AUTOSAR CTA Accreditation application rules for ISO 17025

5 Release 3.0 – Document Overview

5.1 Release Validity Information

According to the Release Management Process Definition [4], this Release 3.0 in its latest Revision 7 has the validity status "Valid".

5.2 Cluster: Main Documents

As of the latest Revision 7, the following Main Documents are part of Release 3.0:

Deliverable	Classifi-	Version	Status	File Name
	cation			
Main Requirements	std	2.1.0	Final	AUTOSAR_MainRequirement
				s
Glossary	std	2.1.2	Final	AUTOSAR_Glossary

6 Remarks to Known Technical Deficiencies

6.1 Deliverable: General Requirements on Basic Software Modules

The BSW Scheduler starts calling the cyclically scheduled Main Functions right after it has been initialized. The initialization takes place block-wise (as specified in the ECU State Manager) right after the OS has been started and before Initialization Block II, RTE and Initialization Block III are started and executed. This can lead to the situation that a Main Function of a scheduled BSW module gets called before the initialization of the respective module. To let this occur, depends primarily on the following factors:

- 1. Configuration of the schedule tables:
 - The lower the initial offset, the more likely the miss-behavior will be.
- 2. Number and identity of modules in Init Block II and Init Block III (integrator dependent):
 - The more modules in Init Block II and III, the more time the initialization will consume and the more likely the miss-behavior will be
 - Certain modules need more initialization time than other modules
- 3. Speed of NVRAM, amount of NVRAM data:
 - The slower the NVRAM or the more NVRAM data is to be read during startup, the more time initialization it will take, so the more likely the miss-behavior will be.

6.2 Deliverables: Specifications of FlexRay Interface, MCU Driver and PDU Router

According to the AUTOSAR Architecture, Complex Device Drivers can interface to all architectural layers. However, for the following BSW modules this has not been taken into account:

- Flexray Interface
- PDU Router
- MCU driver

The writer of a Complex Device Driver needs to implement a module extension for the above mentioned BSWs.

6.3 Deliverable: Specification of FlexRay Interface

- 1. The FlexRay interface does not support the AUTOSAR COM communication mode "NONE", i.e., the FlexRay interface does not support independant pull of data from COM for transmission.
- 2. If the message transmission task is pre-empted while transmitting in the dynamic segment, there is a risk for overrun in the Transmission Confirmation Counter.

6.4 Deliverable: Specification of Operating System

The synchronization of the AUTOSAR OS to the FlexRay Global Time using the FlexRay Interface is not completely defined and standardized.

6.5 Deliverable: Specification of Generic Network Management Interface

This release mainly supports synchronization between two or more AUTOSAR CAN subnets. When time-triggered (or cyclical) bus protocol need to be coordinated on subnets, this release has conceptual shortcomings for one such subnet, and unresolved issues in case of more than one such subnet. This is due to missing mechanisms for synchronizing event oriented NM protocols with cyclical or time triggered oriented protocols.

Hence, the coordination of one FlexRay subnet with CAN subnets managed by AUTOSAR NM are within this release possible only either with limited accuracy, or by evaluating information passed between FlexRay NM and Communication Manager. Coordination of more than one such subnet (i.e. time-triggered or cyclic bus protocols) is not possible.

6.6 Deliverable: Specification of LIN State Manager

The AUTOSAR LIN modules are currently using the term "channel" do describe a connection to the LIN bus. The correct term is "controller".

Currently no complete error concept is implemented in the AUTOSAR LIN modules. The LIN modules will detect errors on the bus but cannot detect failing/missing slave nodes.

There is no standardized means in place to switch LIN Schedule Tables. Hence, there is no user of the function LinSM_ScheduleRequest.

The LIN State Manager module can only be used as a LIN master in a LIN cluster. There at most one instance of the LIN State Manager in each ECU. If the underlying LIN Driver 0 supports multiple channels, the LIN State Manager may be master on more than one cluster.

6.7 Deliverable: Specification of Diagnostic Communication Manager

The configuration has not been updated according to the changes made on the DCM specification between the Release 2.1 and Release 3.0. For that reason it is not possible to configure the newly added functionality. That impacts the configuration of the interfaces between DCM and RTE, and all resulting configuration parameters.

6.8 Deliverable: Specification of Watchdog Manager

Release 3.0 Rev 7

The current concepts of the Watchdog Manager cannot reliably handle windowed watchdogs. The timing of watchdog triggering is controlled by the Basic Software Scheduler. Since it does not allow to control jitter, the current Watchdog Manager cannot guarantee that the triggering takes place within a certain window of time.

6.9 Deliverable: Specification of I/O Hardware Abstraction

The assumption to base the I/O Hardware Abstraction on the SW Component Template is only partially true, since the latter is only allowed to specify communication to be routed through the Runtime Environment (RTE).

In general the handling of I/O Hardware Abstraction and especially the concept of ECU Signals by AUTOSAR Methodology and the required support by AUTOSAR Templates is not defined yet and might be refined and changed.

Further, in the current AUTOSAR Release 3.0 it is not defined how far standardized parameters are applicable for non-standardized Basic Software. However, I/O Hardware Abstraction is implemented as firmware and might not require such configurability.

Especially it is not defined:

- how a single set of parameter shall be applied to a modular I/O Hardware Abstraction.
- how parameters having impact on the AUTOSAR interface which is not configurable shall be applied.

6.10 Deliverable: ECU Resource Template

The current AUTOSAR Methodology does not sufficiently describe the use cases for the ECU Resource Template, i.e. which artifacts can be built with the template and for which specific activities the information is used as an input.

It is currently not possible to verify the content of the template in order to determine specific deficiencies and possible improvements.

6.11 Deliverable: SW-C and System Modeling Guide and Naming Conventions

The XML code which is shown in the document is compliant to the AUTOSAR XML Schema as of Release 2.0.

For the following physical units, no key words were defined in this Release 3.0:

Gram, Volt, Ampere, Ohm, Watt, Liter, Gallone, Siemens, Farad, Kelvin, Joule, Hertz, Promille, Radiant, Minute, Hour, Day, Month, Bar, Pascal,

The current naming convention assumes that physical units are made of a base unit and an exponent (e.g. "10⁻³" for "milli"). However, the prefix used for multiples of base

Release 3.0 Rev 7

units is not defined as part of the naming convention. Hence, there are limitations in defining domain specific units (e.g. air mass flow: mg per stroke).

Chapters 6.4.3 and 6.4.8

The created names for DataElementPrototypes and PortPortotypes do not consider requirements of Field and Test engineers concerning "search ability" and it is not defined how a human readable and understandable link to displayed names in Measurement & Calibration tooling shall be provided. Therefore the naming rules for these model elements might be changed

6.12 Deliverable: Integrated Master Table of Application Interfaces

The definition of "core / conditional / optional" shall not be considered as part of the Release 3.0. This definition is not consistently applied between the Powertrain and Chassis domain. That is, that information concerning "core / conditional / optional" attributes in the Integrated Master Table shall be ignored in the Release 3.0.

7 Revision History of the Release 3.0

Date	Revision	Deliverable Name	Version	Description State	on
30-Sep-10	7	Virtual Functional Bus	1.1.0	modified	Last-is-best N:1 S/R communication allowed
		General Requirements on Basic Software Modules	2.3.0	modified	[BSW00414] adapted for clarification regarding the configuration parameter of the Init functions in case of precompile variants [BSW00406]: Relax module initialization checks for MainFunctions (no DET error) [BSW00408] Relaxing the requirement to allow different configuration names
		Specification of Platform Types	2.3.0	modified	Replaced generic <module> by "PLATFORM" in chapter 10</module>
		Specification of Standard Types	1.3.0	modified	Changed <module> to STD_TYPES in default parameters</module>
		Specification of Communication Stack Types	2.3.0	modified	Published information of the document is updated
		Specification of Memory Mapping	1.2.0	modified	MEMMAP003 changed: Application hint added for the handling of INLINE code implementation.
		Basic Software UML Model	2.4.0	modified	Changes according to changes in AUTOSAR specifications
		Specification of RTE Software	2.3.0	modified	 Generation of the indirect API decoupled from multiple instantiation: changed rte sws 1355, rte sws 2613, rte sws 2615. Behavior in name clashes of AUTOSAR types PIM types: added rte sws 5195, changed rte sws 3789, rte sws 3782.
		Specification of LIN Interface	2.1.0	modified	Updated LINIF226 Use PduInfoType for RxIndication, TriggerTransmit and Transmit APIs Clarification of time parameters specified as float
		Specification of LIN Driver	1.3.0	modified	Add LIN184
		Requirements on CAN	2.3.0	modified	BSW01017 requirement for CAN polling/interrupt mode removed
		Specification of CAN Transport Layer	2.3.0	modified	Removed CanTp228 Updated CanTp246, CanTp248
		Specification of CAN Interface	3.2.0	modified	

Date	Revision	Deliverable Name	Version	Description State	on
			version	State	Entered function CanIf_GetTxConfirmationState Entered description and SWSItemIds CANIF739 and CANIF740
		Specification of CAN Driver	2.4.0	modified	Updated CAN271 and CAN234
		Specification of CAN Transceiver Driver	1.3.0	modified	Explanation added to chapter 7.4 Updated CanTrcv150
		Requirements on Communication	2.2.0	modified	Updated BSW02043, allowing to receive I-PDUs partially
		Specification of Communication	3.2.0	modified	 Added COM572, COM573, COM568, COM569, COM570, COM571, COM574, COM575 Updated COM001, COM314, COM391, COM501, COM100, COM287, COM123, COM001, COM187, COM184
		Specification of I-PDU Multiplexer	1.3.0	modified	Added a pre-compile configuration variant Added IPDUM162 in configuration container IpduMTxRequest and IpduMRxIndication Updated IPDUM032, IPDUM060, IPDUM040, IPDUM043, IPDUM060 Added IPDUM163
		Specification of Generic Network Management Interface	1.1.0	modified	Fix of description of Nm_State_Notification
		Specification of FlexRay Network Management	3.1.0	modified	Updated FRNM021, FRNM305, FRNM316, FRNM317, FRNM256, FRNM257 Added FRNM340, FRNM376, FRNM393, FRNM338, FRNM342, FRNM378, FRNM379, FRNM380, FRNM383, FRNM384, FRNM385, FRNM386, FRNM318, FRNM315 Deleted FRNM318, FRNM306
		Specification of CAN Network Management	3.2.0	modified	Harmonization of CanNm_RxIndication signature
		Specification of FlexRay Transport Layer	2.3.0	modified	 Added FRTP222, FRTP223 Modified FRTP195 Use parameter PduInfoType in callback RxIndication
		Specification of FlexRay Interface	3.1.0	modified	Update sequence chart 9-6 Extension of Frlf05063 (behavior in case of return value E_NOT_OK for API TriggerTransmit()
		Specification of FlexRay Transceiver Driver	1.3.0	modified	Clarification of transitions – added FrTrcv474
		Specification of PDU Router	2.3.0	modified	 Added support for Gatewaying longer I-PDUs that configured Added return type to TriggerTransmit APIs Changed to PduInfoType in RxIndication
		Specification of NVRAM	2.3.0	modified	
		Manager			 Behavior specified to prevent possible

Date	Revision	Deliverable		Description	on
		Name	Version	State	
					 Typo corrected in chapter 7.1.2.1 Behavior specified: handling of single-block callbacks during asynchronous multi-block requests Behavior specified when NVRAM block ID 1 shall be written Include of Crc.h is not optional
		Specification of CRC Routines	3.1.0	modified	Check value for J1850 CRC8 changed from F4h to 4Bh
		Specification of ECU State Manager	1.3.0	modified	Added EcuM3020 Fixed description in EcuM2904 Update description ErrorHook Change of AppMode Update ErrorHook with note Added note for exit from GO SLEEP Reformulated EcuM2863 and added rationale Added a note to EcuM_AL_SwitchOff
		Specification of Communication Manager	2.1.0	modified	Parameter name inconsistency (InhibitionStatusType <> ComM_InhibitionStatusType) A type InhibitionStatusType is defined for the RTE interface, whilst the corresponding "module internal" type is named ComM_InhibitionStatusType. In order to be consistent with other types like ComM_ModeType, which are named equally as "module internal" and "RTE interface" types, the RTE interface type InhibitionStatusType should be renamed to ComM_InhibitionStatusType.
		Main Requirements	2.1.0	modified	Updated Main270
		Software Component Template	3.2.0	modified	Fixed usage of Categories in XML examples Signal invalidation mechanism becomes optional
		System Template	3.3.0	modified	Clarified semantics of Transfer Property for signal groups Clarified semantics of ByteOrder attributes Updated upstream template mapping of GdMaxMicrotick Added the new transfer property TriggeredOnChange to ComTransferProperty Added missing FlexRayNm and CanNm parameters Clarified the usage of EcuPorts in Ecu Extract Made Flexray channel specific attributes optional
		Model Persistence Rules for XML	2.2.0	modified	Updated default configuration of tagged values Updated default configuration of multiplicities
		Meta Model	3.3.0	modified	Changes according to changes in Templates

Date	Revision	Deliverable Name	Version	Description State	on
		Meta Model-generated XML Schema	3.3.0	modified	Changes according to changes in Templates
		Basic Software Module Description Template	1.1.0	modified	Added option to MemorySection
		Specification of CAN State Manager	1.2.0	modified	Add CANSM341, CANSM340, CANSM242, CANSM243 Updated CANSM340, CANSM219, CANSM045, CANSM219, CANSM231
		Specification of FlexRay State Manager	1.1.0	modified	Added notification for FrNm in case of a long term synchronization loss StartupRepetitions made optional to allow for unlimited repetition of startup Introduction of CANSM_RX_PDU_INIT and CANSM_TX_PDU_INIT, update of Com_IpduGroupStart
		Specification of LIN State Manager	1.1.0	modified	Chapter 10 updated to have configurable "initialize" in call to Com_lpduGroupStart
		Specification of ECU Configuration Parameters (XML)	2.3.0	modified	Changes according to changes in AUTOSAR specifications
		Integrated Master Table of Application Interfaces (XML Schema R3.0)	1.0.4	modified	Adapted namespace
02-Feb-10	6	Meta Model-generated XML Schema	3.2.0	modified	Two string attributes shall be added to the System class: System Version (mandatory) - Version number of the System Description. Ecu Extract (optional) - Version number of the Ecu Extract. Allow the optional description of CAN Communication timing attributes as a range.
		Basic Software UML Model	2.3.0	modified	In Figure 15 of the Canlf SWS Activities of SLEEP transition" on page 57 the part "+ do/Canlf_SetWakeupEvent(Controller, WakeupSource)" in state CANIf_CS_STOPPED has to be removed. Create new CAN artefacts with updated BSW UML Model
		Specification of ECU Configuration	2.2.0	modified	Updated definition how symbolic names are generated from the EcuC
		Specification of ECU Configuration Parameters (XML)	2.2.0	modified	The multiplicity of parameter McuClockSettingConfig has been changed to 1* Improve configuration and interoperation of CanNm and CanIf Added: CANIF300, CANIF301, CANIF_HRHRANGE_CANIDTYPE In chapter 10.2.4 of the CanIf, the parameter CanIfWakeupEventApi has to be removed from the configuration container CanIfPublicConfiguration CanDrv: Added missing literal specification for CanBusoffProcessing,

Date	Revision	Deliverable		Description	on
		Name	Version	State	
					CanRxProcessing, CanTxProcessing, CanWakeupProcessing Com: Added missing literal specification for ComSignalEndianess, ComSignalType in the ComGwSource and ComGwDestination description. PortDrv: Added missing literal specification for PortPinInitialMode The parameters CanSMBorCounterL1ToL2, CanSMBorCounterL2Err, CanSMBorTimeL1, CanSMBorTimeL2, CanSMBorDisableRxDIMonitoring, CanSMBorTimeTxEnsured shall be shifted from CanStateManagerConfiguration to CanStateManagerNetworks Use the float data type consistently in all documents (update SWS CanNm)
		Specification of Interoperability of Authoring Tools	1.3.0	modified	Updated semantics of identifier wrt lower/upper case
		Meta Model	3.2.0	modified	Clarify description of the "EventControlledTiming" Make the NPdu a subclass of IPdu in order to allow the specification of Pdurouting for NPdus. Add constraints to the existing references to IPdus (in the SystemTemplate TP sections) in order to exclude NPdus from the ""tpSdu"" references.NPdus. Allow for providing initial values for calibration parameters Add the literals definitions to the EnumerationParamDef for ComSignalType, ComSignalEndianess.
		Software Component Template	3.1.0	modified	Allow for communication attributes in compositionTypes; Allow for providing initial values for calibration parameters
		Specification of CAN Driver	2.3.0	modified	Description of Multiplexed Transmit Functionality improved. Reference to Canlf_SetWakeupEvent replaced by EcuM_CheckWakeup. Added missing literal specification for CanBusoffProcessing, CanRxProcessing, CanTxProcessing, CanWakeupProcessing SchM_Can.h included in File Structure Create new CAN artefacts with updated BSW UML Model
		Specification of CAN Interface	3.1.0	modified	Added: CANIF300, CANIF301, CANIF_HRHRANGE_CANIDTYPE Changed description of function parameter of <user_rxindication> (CanNm) Changed CANIF038, 3rd and 4th</user_rxindication>

Date	Revision	Deliverable		Description	on
		Name	Version	State	
					paragraph of chapter 7.19.1, Figure 13, Figure 15. Deleted: CANIF_WAKEUP_EVENT_API, CANIF270, bullet point 4 of 2nd paragraph of chapter 7.24, bullet point 4 of CANIF126
		Specification of CAN State Manager	1.1.0	modified	Independant parameters for CAN networks. Update of document with generated artifacts.
		Specification of CAN Network Management	3.1.0	modified	Improved configuration and interoperation of CanNm and CanIf
		Specification of MCU Driver	2.3.0	modified	Allow multiplicity of sub-container Mcu Clock Setting
		Specification of PORT Driver	3.1.0	modified	Range insertion for the parameter PortPinInitialMode (PortPin Container) in chapter 10
		Specification of RTE	2.2.0	modified	Allow Communication Attributes on Compositions (RfC#31872): changed rte sws in 0055, rte sws in 0062, rte sws in 5023, rte sws in 5050, rte sws in 0067, rte sws in 0029, rte sws in 2701, rte sws in 2693 Support for initial calibration data values (RfC#38085): added rte sws 7186, rte sws 7185, rte sws 2750. Reverted implementation of RfC#27188 (RfC#41929): changed rte sws 1017, rte sws 1018, rte sws 1019, rte sws 1020, rte sws 5107, rte sws 5108, rte sws 5109, rte sws 5512; added rte sws 5195, rte sws 5512; added rte sws 5195, rte sws 5196, rte sws 5197, rte sws 5198, rte sws 5199, rte sws 5200, rte sws 5201, rte sws 5202, rte sws 5203, rte sws 5204, rte sws 5205, rte sws 5206, rte sws 5207, rte sws 5208, rte sws 5209; removed rte sws 3743; Fixed typo in rte sws 6129, rte sws 3750 (CalPrm vs. Calprm).
		Specification of the System Template	3.2.0	modified	Clarified semantics of references to "ComlPduGroup" Added TransferProperty attribute to ISignalTolPduMapping element. Added extension that allows the specification of ranges for CAN Communication Controller Timing attributes Adapted IPdu Multiplexer model to allow the segmentation of the static and dynamic part. Added LinErrorResponse settings Added version number attributes to the
					System class Added relationships between ISignalTriggering, IPduTriggering,

Date	Revision	Deliverable		Description	on
		Name	Version	State	
					FrameTriggering Added support for low-level routing of NPdu's Updated description and model of the "EventControlledTiming" Modeling of Priorities in Lin Substitution Frames Added CanNm Id Range attributes to CanCluster
		Specification of Communication	3.1.0	modified	Added COM558, COM559. Updated configuration container, due to missing literals in ComGwSourceDescrip-tion and ComGwDestinationDescription. Turned COM385 into a note. COM_NETWORK_SIGNAL_NAME removed from COM401 Tables were wrongly stating that Com_ReceiveShadowSignal should return COM_SERVICE_NOT_AVAILABLE. Updated all configuration containers with correctly generated artefacts.
24-Jul-09	0005	Meta Model-generated XML Schema	3.1.1	modified	Removed errors introduced into XML Schema with R3.0 Rev0004 (e.g. the "REF" definition is available again)
		Specification of ECU Configuration Parameters (XML)	2.1.1	modified	Adaptation of namespace to new schema
		Integrated Master Table of Application Interfaces (XML Schema R3.0)	1.0.3	modified	Adaptation of namespace to new schema
4-Feb-09	0004	List of Basic Software Modules	1.3.0	modified	Correction of LinNM classification
		Basic Software UML Model	2.2.0	modified	see SWS FlexRay NM
		Requirements on RTE Software	1.2.0	modified	Changed RTE00005 (Bug#26607); Removed RTE00044 (Bug#26607)
		Specification of RTE Software	2.1.0	modified	Updated VFB-Tracing (RfC#24177): changes rte sws 1327, rte sws 1328; Unconnected R-Ports are supported (RfC#23898): changed rte sws 1329, rte sws 3019; added rte sws 1330, rte sws 1331, rte sws 1333, rte sws 1334, rte sws 1336, rte sws 1337, rte sws 1346, rte sws 2621, rte sws 2638, rte sws 2639, rte sws 2640, rte sws 3785, rte sws 5099, rte sws 5100, rte sws 5101, rte sws 5102; Incompatible function declarations (RfC#27188): changed rte sws 1018, rte sws 1019, rte sws 1020; added rte sws 5107, rte sws 5108, rte sws 5109; removed rte sws 6030; Insufficient RTE server mapping requirement (RfC#25712): changed rte
		Specification of FlexRay	3.0.2	modified	sws 2204. Incorporation of core partner change
