#### Advice for users

AUTOSAR Specification Documents may contain exemplary items (exemplary reference models, "use cases", and/or references to exemplary technical solutions, devices, processes or software).

Any such exemplary items are contained in the Specification Documents for illustration purposes only, and they themselves are not part of the AUTOSAR Standard. Neither their presence in such Specification Documents, nor any later documentation of AUTOSAR conformance of products actually implementing such exemplary items, imply that intellectual property rights covering such exemplary items are licensed under the same rules as applicable to the AUTOSAR Standard.

## 1 Introduction and functional overview

This specification describes the functionality, APIs and the configuration of the AUTOSAR Basic Software module I-PDU Multiplexer IpduM.

PDU multiplexing means using the same PCI (Protocol Control Information) of a PDU (Protocol Data Unit) with more than one unique layout of its SDU (Service Data Unit). A selector field is a part of the SDU of the multiplexed PDU. It is used to distinguish the contents of the multiplexed PDUs from each other.

Multiplexing of PDUs is currently known from CAN, but is not restricted to this communication system.

On sender-side, the I-PDU Multiplexer module is responsible to combine appropriate I-PDUs from COM to new, multiplexed I-PDUs and send them back to the PDU-Router. On receiver-side, it is responsible to interpret the content of multiplexed I-PDUs and provide COM with its appropriate separated I-PDUs taking into account the value of the selector field.

# 2 Acronyms and abbreviations

| Abbreviation /    | Description:  |  |
|-------------------|---|--|
| Acronym:          |   |  |
| IpduM             | I-PDU Multiplexer   |  |
| Dynamic part      | see [6]   |  |
| Static part       | see [6]   |  |
| Selector field    | see [6]   |  |
| Signal            | see [7]   |  |
| Signal group      | see [7]   |  |
| Sub part          | The static or dynamic part may consist of more than one element. These  |  |
|                   | sub-elements are called sub-parts; see also <a href="https://example.com/IPDUM006">IPDUM006</a> and Figure 2. |  |
| COM I-PDU         | I-PDU assembled in the COM module out of COM Signals  |  |
| IpduM I-PDU       | I-PDU assembled in the IpduM module out of two COM I-PDUs   |  |
| Multiplexed I-PDU | see IpduM I-PDU   |  |
| Instance          | IpduM I-PDU with one specific layout and content  |  |

### 3.2 Related standards and norms

None

# 4 Constraints and assumptions

### 4.1 Limitations

For transmission of multiplexed I-PDUs, minimum delay time observation cannot be taken into account. For more details, see [7] and 7.4.1.

# 4.2 Applicability to car domains

No restrictions.

# 4.3 Applicability to safety related environments

This document has been created in absence of a safety case and a safety plan. Thus, the direct results of this document can only be used within safety relevant systems after repeating certain process steps as required in the IEC 61508.

# 5 Dependencies to other modules

This chapter lists all the features from other modules that are used by the AUTOSAR lpduM and functionalities that are provided by AUTOSAR lpduM to other modules. Because of the position of the lpduM module in the layered architecture, it has only interfaces to the PDU-Router. See also 7.2.

Because the IpduM module deals with PDUs that are either sourced or sunk by other modules, care must be taken that shared configuration items are consistent between the modules.

#### 5.1 AUTOSAR OS

IPDUM107: The IpduM shall not directly access the AUTOSAR OS.

#### 5.2 BSW Scheduler

IpduM shall use the BSW-Scheduler to schedule its main functions, see also [5].

#### 5.3 PDU-Router

The following summarizes the functionality IpduM needs from the PDU-Router (for more details see Chapter 8.6):

- Indication of incoming multiplexed I-PDUs
- Sending interface for outgoing I-PDUs
- Confirmation of I-PDUs which went out

The following list summarizes the functionality provided by the IpduM module for the PDU-Router module:

- Indication interface for incoming I-PDUs, which are de-multiplexed
- Sending interface for to be multiplexed I-PDUs
- Confirmation interface for transmitted I-PDUs

### 5.4 File structure

### 5.4.1 Code file structure

**Note:** This IpduM SWS does not define the code file structure completely.

**IPDUM095:** The module IpduM shall provide a file IpduM\_Lcfg.c containing the link-time configurable parameters.

**IPDUM096:** The module IpduM shall provide a file IpduM\_PBcfg.c containing the post-build time configurable parameters.

#### 5.4.2 Header file structure

**IPDUM002**: The IpduM module shall comply with the following include-file structure:

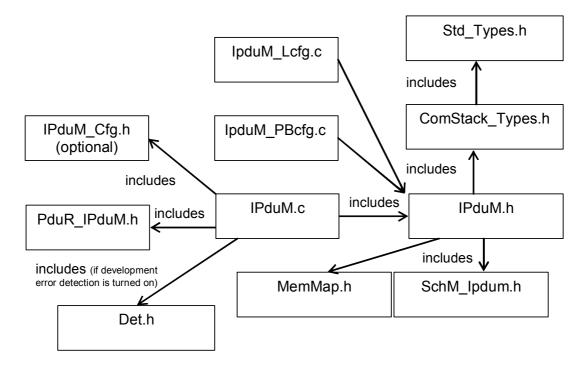

Figure 1 Header File Structure

#### 5.4.3 Design Rules

**IPDUM073**: The code of the IpduM module, as long as it is written in C, shall conform to the HIS subset of the MISRA C Standard.

**IPDUM074**: The code of the IpduM module shall avoid direct use of compiler and platform specific keywords.

**IPDUM075**: The code of the IpduM module shall indicate all global data with readonly purposes by explicitly assigning the const keyword.

**IPDUM076**: The IpduM module can use macros instead of functions where source code is used and runtime is critical.

**IPDUM077**: The IpduM module shall not define global data in the header files. If global variables are used, the definition shall take place in the C file.

**IPDUM078**: The source code of the IpduM module shall not be processor and compiler dependent.

# 7 Functional specification

#### 7.1 Introduction and definitions

O PDU multiplexing means using the same I-PDU ID transferred from the PDU-Router to the Communication Hardware Abstraction Layer with more than one unique layout of this I-PDU; see also [2].

**IPDUM004:** A multiplexed I-PDU consists of a static part and a dynamic part, where the static part consists of zero or more signals or signal groups. The dynamic part consists of the selector field and one or more signals or signal groups; see Figure 2.

**Note:** The dynamic part of an I-PDU is comparable with a union in "C". With help of the selector field inside the I-PDU, the actual layout of the I-PDU is selected.

**IPDUM005**: The position of the static and the dynamic part of the multiplexer shall be arbitrary and has to be configurable per I-PDU; see Figure 2, for configuration see Chapter 10.2.2.

**IPDUM006**: It shall be possible that the static and the dynamic part consist of more than one element. These elements of the static or dynamic parts are called *sub parts*.

**IPDUM007**: There shall be only one selector field within one multiplexed I-PDU.

**IPDUM008**: The value of the selector field shall define how the content of the dynamic part of the I-PDU shall be interpreted.

**IPDUM009**: The selector field of one I-PDU shall have a configurable size between one and eight contiguous bits.

**IPDUM010**: The position of the selector field within the I-PDU shall be defined by configuration.

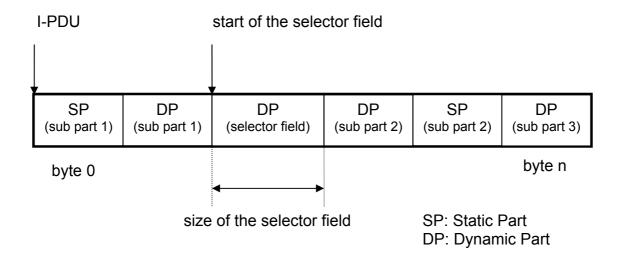

Figure 2 Possible layout of a multiplexed I-PDU

**IPDUM011**: The number of values used of the selector field, i.e. values used to distinguish between different I-PDU layouts, does not have to be the whole range of possible values.

**Example:** The size of a selector field with 3 bits leads to 2<sup>3</sup> possible selector field values; it shall be allowed to use only a part of these values.

**Note:** Multiplexing of PDUs is currently only known from CAN, but it is not restricted to this communication system.

However, because the module is layered next to the PDU-Router above the interface layer (Communication Hardware Abstraction) in the AUTOSAR layer architecture this feature also could be used with LIN or FlexRay.

#### 7.2 Overview

The IpduM is arranged next to the PDU-Router in the layered architecture of AUTOSAR; see [2] and Figure 3.

**IPDUM097:** The lpduM shall be implemented so that no other modules depends on it and that it is be possible to build a system without the lpduM module if it is not needed.

**IPDUM013:** The configuration of COM shall be such that each part of a multiplexed I-PDU, the static part and the different dynamic parts, are configured as different I-PDUs in COM.

**Note:** There is one COM I-PDU for the static part and one COM I-PDU for each layout of the dynamic part of one IpduM I-PDU, so the IpduM always combines only two I-PDUs of COM.

**IPDUM098:** The IpduM module shall not set the selector field.

**IPDUM099:** The configuration of COM shall be such that the selector field is part of the COM I-PDU for the dynamic part.

**Note:** This could be realized by defining a signal for the selector field in each instance of the dynamic part. This signal is initialized with the default value by the configuration of COM but never written during runtime.

For a detailed description of the transmission and reception of a multiplexed I-PDU see Chapter 7.4 and 7.5.

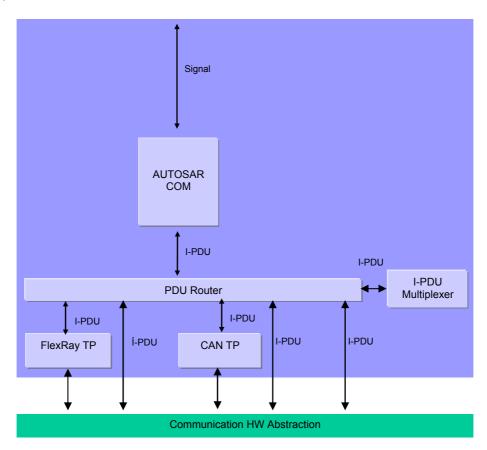

Figure 3 I-PDU Multiplexer in the Autosar Architecture

It should be allowed to optimize the receive and TxConfirmation path from the IpduM module via the PDU-Router module to the COM layer to call the COM API directly from the IpduM module without including the PDU-Router.

#### 7.3 Initialization

The IpduM module provides an initialization function Ipdum\_Init defined in IPDUM032. This function initializes all internal global variables and the buffers of the IpduM I-PDUs. For more details, see Chapter 8.3.1.

**IPDUM092:** The environment of the IpduM shall call Ipdum\_Init before calling any other function of the IPDUM module.

For the I-PDU data transmission pathway through the IpduM module a buffer is allocated inside the IpduM module. This buffer needs to be initialized in case it is transmitted before it has been fully populated with data by COM. The initialization data for this buffer is arrived at as follows using configuration data from the IpduM Tx Request container.

- 1) **IPDUM067**: The buffer is first filled with the pattern defined in the configuration parameter IPduMIPduUnsuedAerasDefault.
- 2) **IPDUM068**: The initial selector field IpduMInitialSelectorValue is used to determine from COM's configuration the initial value of the dynamic part. The initial value of the static part is determined by COM's initial value for the incoming I-PDU.
- 3) **IPDUM069**: Finally, the selector field, indicated by the IpduMBitField container is filled with the value in the configuration parameter IpduMInitialSelectorValue.

For optimization, the initial bit pattern for the buffer can be worked out at configuration-time and then copied at run-time.

#### 7.4 Transmission

Inside COM, there are separated I-PDUs for the static part and one for each dynamic part of a multiplexed I-PDU.

The static part and the dynamic parts are treated in COM as separate I-PDUs with their own I-PDU IDs.

**IPDUM063**: The configuration of the PDU-Router module (e.g. look-up tables) shall be such that the I-PDUs, which belong to multiplexed I-PDUs and represent a static or a dynamic part of a multiplexed I-PDU, are routed to the IpduM module.

**IPDUM015**: The IpduM module shall merge the two I-PDUs (the static part and the last received dynamic part) into one single I-PDU with a new unique I-PDU ID, which is sent out to the PDU-Router module.

For details about the trigger of the transmission, see Chapter 7.4.2.

**Note:** All control functionalities like deadline monitoring of the COM I-PDUs and update-bit evaluation are out of the scope of the IpduM and have to be done by the COM layer. For details about the timing-behavior of the new combined I-PDU see Chapter 7.4.2.

#### 7.4.1 Transmission request

The IpduM module provides an Ipdum\_Transmit function so that the PDU-R is able to initiate the transmission of an I-PDU; see <a href="IPDUM043">IPDUM043</a>.

**IPDUM017**: The function Ipdum\_Transmit (called with a COM I-PDU) shall assemble the related IpduM I-PDU, using the related static and dynamic part, and transmit it according to the trigger conditions.

As defined in Chapter 7.3, each outgoing I-PDU has an initial value so that, should an I-PDU be transmitted by the IpduM module before both static and dynamic parts have been sent from COM to the IpduM, a value defined by the configuration is transmitted.

**IPDUM019**: The configuration of the IpduM shall contain a dedicated timeout for each IpduM I-PDU within the IpduM module in the configuration parameter IpduMTxConfirmationTimeout.

This timeout defines until when the transmission confirmation for this I-PDU has to be received after the transmission. For transmission confirmation see Chapter 7.4.3.

**Note:** The timeout period shall take into account the delays in the lower layers.

**IPDUM020**: As long as the timeout (defined in the configuration parameter IpduMTxConfirmationTimeout) has not elapsed and as long as no transmission confirmation for the IpduM I-PDU is received, the function Ipdum\_Transmit shall not allow a new transmission request from the upper layer with a COM I-PDU that belongs to the same IpduM I-PDUs. In that case, the function IpduM\_Transmit shall return with E NOT OK.

**Note:** It maybe useful to configure the IpduM transmission confirmation timeout depended of the transmission deadline monitoring timeouts for the single COM I-PDUs of the COM layer configuration; see also [7].

#### 7.4.2 Transmission trigger

The IpduM module receives the static and the dynamic part of a multiplexed I-PDU by separated two transmission requests as two single COM I-PDUs from the PDU-Router module.

**IPDUM021:** The IpduM module shall be configurable to send a transmission request for the new multiplexed I-PDU to the PDU-Router because of

- receiving a static part
- receiving a dynamic part
- receiving a static or a dynamic part
- does not trigger transmission because of receiving anything of this I-PDU.

For configuration, see <a href="IPDUM052">IPDUM052</a>.

**Note:** By this mechanism, it is possible to control the transmission mode of the new assembled I-PDU by the transmission modes of the single I-PDUs sent by COM, see also [7].

**Note:** By this realization, it is not possible to guarantee the minimum delay time between consecutive transmissions of different instances of multiplexed I-PDUs, because if the transmission is triggered by static and dynamic part or only by the dynamic part, COM does not take care for the minimum delay time. COM treats the static part and the different dynamic parts as stand-alone I-PDUs, which are not connected together.

**Note:** The configuration "does not trigger transmission because of receiving anything" is needed if an I-PDU is only sent out because of a TriggerTransmit of a lower layer.

With the API Ipdum\_TriggerTransmit it is possible for lower layers to trigger a send out of an I-PDU.

#### 7.4.3 Transmission confirmation

Transmission confirmations are given to the IpduM module by the PDU-Router according to the configuration of the I-PDUs in the PDU-Router module look-up tables.

**IPDUM022**: If the IpduM receives a TxConfirmation for a specific IpduM I-PDU, it shall translate this confirmation into the corresponding confirmations for the COM I-PDUs, which were contained in the last sent out multiplexed IpduM I-PDU.

**Note:** Depending on the configuration there are zero, one or two confirmations given to COM for one send request.

**IPDUM023**: If the TxConfirmation is not received within the configured timeout IpduMTxConfirmationTimeout the IpduM shall allow new transmission requests for this specific I-PDU after timeout is elapsed.

**IPDUM024**: The IpduM shall discard unexpected TxConfirmations silently. This may happen if a previously requested transmit has been timed out, but is confirmed now.

**Note:** There need not to be an error entry in the case of timeout violation because this is already done in COM, if needed. In the case of a proper configuration of the communication stack, the timeout violation in the IpduM modules occurs at the same time than the Deadline Monitoring violation in the COM module.

## 7.5 Reception

Every I-PDU which is received by the Hardware Abstraction Layer (CAN Interface, Lin Interface, Flexray Interface) is given to the PDU-Router. The PDU-Router routes multiplexed I-PDUs to the IpduM module. The IpduM module separately routes the static and dynamic parts of the multiplexed I-PDU to their destinations.

It is known at configuration-time which incoming I-PDU IDs correspond to multiplexed I-PDUs with a static part configured. The I-PDU ID is all that is necessary to work out if there is a static part present.

As all multiplexed I-PDUs contain a dynamic part this part always has to be routed.

For requirements description see Chapter 8.3.3.

#### 7.6 Error classification

**IPDUM026:** The following errors and exceptions shall be detectable by the IpduM module depending on its build version (development/production mode):

| Type or error                                  | Relevance   | Related error code | Value [hex] |
|--|-------------|--------------------|-------------|
| API service called with wrong parameter        | Development | IPDUM_E_PARAM      | 10          |
| API service used without module initialization | Development | IPDUM_E_UNINIT     | 20          |

**IPDUM106:** Development error values are of type uint8.

### 7.7 Error detection

**IPDUM027:** The detection of development errors is configurable (*ON / OFF*) at precompile time. The switch IpduMDevErrorDetect (see Chapter 10) shall activate or deactivate the detection of all development errors.

**IPDUM028:** If the IpduMDevErrorDetect switch is enabled API parameter checking is enabled. The detailed description of the detected errors can be found in Chapter 7.6 and Chapter 8.

**IPDUM029:** The detection of production code errors cannot be switched off.

**Note:** Actually, there are no production errors defined for the lpduM.

#### 7.8 Error notification

**IPDUM030:** The IpduM module shall report detected development errors to the error hook of the Development Error Tracer (DET) if the pre-processor switch IpduMDev-ErrorDetect is set, see Chapter 10.

# 8 API specification

# 8.1 Imported types

This chapter lists all imported types and the corresponding header files.

#### **IPDUM102:**

| Header file      | Imported Type       |  |
|------------------|---------------------|--|
| Std_Types.h      | Std_ReturnType      |  |
|                  | Std_VersionInfoType |  |
| IPduM_Types.h    | Ipdum_ConfigType    |  |
| ComStack_Types.h | PduldType           |  |
|                  | PduInfoType         |  |

# 8.2 Type definitions

# 8.2.1 **Ipdum\_ConfigType**

| Name:  | Ipdum_ConfigType   |
|--------|--|
| Туре:  | Structure  |
| Range: | Implementation specific.   |
| •      | This is the type of the data structure containing the initialization data for the I-PDU multiplexer. |

#### 8.3 Function definitions

This is a list of functions provided for upper layer modules.

### 8.3.1 **Ipdum\_Init**

#### **IPDUM032:**

| Service name:       | lpdum_Init  |  |
|---------------------|---|--|
| Syntax:             | void Ipdum_Init(     const Ipdum_ConfigType* config )                   |  |
| Service ID[hex]:    | 0x00  |  |
| Sync/Async:         | Synchronous   |  |
| Reentrancy:         | Non Reentrant   |  |
| Parameters (in):    | config Implementation specific structure with configuration parameters. |  |
| Parameters (inout): | None  |  |
| Parameters (out):   | None  |  |
| Return value:       | None  |  |
| Description:        | Initializes the I-PDU Multiplexer.                                      |  |

**IPDUM033:** The function Ipdum\_Init shall initialize all module-related global variables.

**IPDUM034:** The function Ipdum Init shall initialize all I-PDUs with the default values.

**IPDUM035:** The function Ipdum\_Init shall initialize the default value of the selector field with a configurable value.

**IPDUM064:** The function Ipdum\_Init shall initialize the states of the timeout monitors.

**IPDUM065:** The function Ipdum\_Init shall initialize the state of the TxConfirmation IDs.

**IPDUM083:** In case, the configuration parameter IpduMDevErrorDetect equals TRUE: if the parameter config does not correspond to a valid configuration, the function Ipdum\_Init shall raise the development error IPDUM\_E\_PARAM.

**IPDUM084:** The behavior of the IpduM is unspecified until a correct call to Ipdum\_Init is made.

### 8.3.2 Ipdum\_GetVersionInfo

#### IPDUM037:

| Service name:       | Ipdum_GetVersionInfo  |  |  |
|---------------------|---|--|--|
| Syntax:             | void Ipdum_GetVersionInfo( Std_VersionInfoType* versioninfo )                 |  |  |
| Service ID[hex]:    | 0x01  |  |  |
| Sync/Async:         | Synchronous   |  |  |
| Reentrancy:         | Non Reentrant   |  |  |
| Parameters (in):    | None  |  |  |
| Parameters (inout): | None  |  |  |
| Parameters (out):   | versioninfo Pointer to where to store the version information of this module. |  |  |
| Return value:       | None  |  |  |
| Description:        | Service returns the version information of this module.                       |  |  |

**IPDUM038:** The function Ipdum\_GetVersionInfo shall return the version information of this module. The version information includes:

- Module ID
- Vendor ID
- Vendor specific version numbers (BSW00407).

**IPDUM039:** The function Ipdum\_GetVersionInfo shall be pre compile time configurable On/Off by the configuration parameter: IpduMVersionInfoApi

**IPDUM085:** If source code for caller and callee of the function Ipdum\_GetVersionInfo are available, the module Ipdum should realize this function as a macro, defined in the module's header file.

## 8.3.3 **Ipdum\_Transmit**

#### IPDUM043:

| Service name:       | Ipdum_Transmit  |  |  |
|---------------------|---|--|--|
| Syntax:             | Std_ReturnType Ipdum_Transmit( PduIdType PdumTxPduId, const PduInfoType* PduInfoPtr ) |  |  |
| Service ID[hex]:    | 0x03  | 0x03   |  |
| Sync/Async:         | Synchronous   |  |  |
| Reentrancy:         | Non Reentrant for the same PDU-ID. Reentrant for different PDU-ID.                    |  |  |
| Parameters (in):    | PdumTxPduld PduInfoPtr  | ID of I-PDU to be transmitted. Range: 0(maximum number of I-PDU IDs which are mutliplexed) - 1 A pointer to a structure with I-PDU related data that shall be transmitted: data length and pointer to I-SDU buffer |  |
| Parameters (inout): | None  |  |  |
| Parameters (out):   | None  |  |  |
| Return value:       |   | E_OK: Transmit request is accepted E_NOT_OK: Transmit request is not accepted  |  |
| Description:        | Service is called by the PDU-Router to request a transmission.                        |  |  |

For a detailed description read Chapter 7.4.1.

### 8.4 Call-back notifications

### 8.4.1 **Ipdum\_RxIndication**

#### **IPDUM040:**

| Service name:       | lpdum_RxIndica  | ation  |
|---------------------|---|--|
| Syntax:             | void Ipdum_RxIndication( PduIdType PdumRxPduId, const PduInfoType* PduInfoPtr ) |  |
| Service ID[hex]:    | 0x02  |  |
| Sync/Async:         | Synchronous   |  |
| Reentrancy:         | Non Reentrant for the same PDU-ID. Reentrant for different PDU-ID.              |  |
|                     | PdumRxPduId ID of I-PDU that has been received.                                 |  |
| Parameters (in):    |   | Contains the length (SduLength) of the received I-PDU and a pointer to a buffer (SduDataPtr) containing the I-PDU. |
| Parameters (inout): | None  |  |
| Parameters (out):   | None  |  |
| Return value:       | None  |  |

| Description: | Service is called when a multiplexed SDU has to be de-multiplexed. |
|--------------|--|

**IPDUM041:** If there is a static part configured in a multiplexed SDU received from the PDU-R the function Ipdum\_RxIndication transforms the incoming I-PDU ID into the correct I-PDU ID for the static part's destination and then forwards the SDU via the PDU-R, see PduR\_IpdumRxIndication in the PDU-R SWS.

**IPDUM042:** When a multiplexed I-PDU is received from the PDU-R the function Ipdum\_RxIndication uses the incoming I-PDU ID and the selector field to find out the correct I-PDU ID for the dynamic part's destination and then forwards the I-PDU via the PDU-R, see PduR IpdumRxIndication in the PDU-R SWS.

**IPDUM163:** Within the function Ipdum\_RxIndication, the IpduM module shall check the received data length (PduInfoPtr->SduLength) and process only completely received static or dynamic parts.

**Note:** The selector field is part of the dynamic part. Therefore, a dynamic part can only be received, if the selector field is also received.

**IPDUM086:** The function Ipdum\_RxIndication shall be callable in interrupt context, e.g. from receive interrupt.

#### 8.4.2 **Ipdum\_TxConfirmation**

#### IPDUM044:

| Service name:       | lpdum_TxConfirmation   |  |
|---------------------|--|--|
| Syntax:             | void Ipdum_TxConfirmation( PduIdType PdumTxPduId )   |  |
| Service ID[hex]:    | 0x04   |  |
| Sync/Async:         | Synchronous  |  |
| Reentrancy:         | Non Reentrant for the same PDU-ID. Reentrant for different PDU-ID.   |  |
| Parameters (in):    | PdumTxPduId ID of multiplexed I-PDU that has been transmitted. Range: 0(maximum number of I-PDU IDs which are multiplexed) - 1 |  |
| Parameters (inout): | None   |  |
| Parameters (out):   | None   |  |
| Return value:       | None   |  |
| Description:        | This function is called by the lower layer after the I-PDU has been transmitted on the network.                                |  |

**IPDUM088:** The function Ipdum\_TxConfirmation shall translate the confirmation received from the PDU-Router into confirmations for the I-PDUs which where contained in the sent multiplexed I-PDU.

**Note:** These confirmations are given again to the PDU-Router that has to route them to COM.

**IPDUM087:** The function Ipdum\_TxConfirmation shall be callable in interrupt context, e.g. from transmit interrupt.

#### 8.4.3 **Ipdum\_TriggerTransmit**

#### IPDUM060:

| Service name:          | lpdum_TriggerTr  | ansmit  |
|------------------------|--|---|
| Syntax:                | Std_ReturnType Ipdum_TriggerTransmit( PduIdType PdumTxPduId, PduInfoType* PduInfoPtr ) |   |
| Service ID[hex]:       | 0x05   |   |
| Sync/Async:            | Synchronous  |   |
| Reentrancy:            | Non Reentrant for the same PDU-ID. Reentrant for different PDU-ID.                     |   |
| Parameters (in):       | PdumTxPduld  | ID of IPduM I-PDU that is requested to be transmitted by IPduM.   |
| Parameters<br>(inout): |  | Contains a pointer to a buffer (SduDataPtr) to where the SDU shall be copied to. On return, the service will indicate the length of the copied SDU data in SduLength. |
| Parameters (out):      | None   |   |
| Return value:          | _ ,.   | E_OK: SDU has been copied and SduLength indicates the number of copied bytes. E_NOT_OK: No SDU has been copied. SduLength has not been set.                           |
| Description:           | Service is called  | by the lower layer when an IPduM I-PDU shall be transmitted.  |

**IPDUM090:** The function Ipdum\_TriggerTransmit shall copy the contents of its I-PDU transmit buffer to the I-PDU buffer given by SduPtr.

**IPDUM091:** The IpduM shall take care about the data consistency during providing the data.

**Use case:** This function is used e.g. by the LIN Master for sending out a LIN frame. In this case, the trigger transmit can be initiiated by the Master schedule table itself or a received LIN header.

This function is also used by the FlexRay Interface for requesting PDUs to be sent in static part (synchronous to the FlexRay global time).

**IPDUM089:** The function Ipdum\_TriggerTransmit shall be callable in interrupt context.

#### 8.5 Scheduled functions

Most of the functions of the IpduM module are called synchronous in the context of the upper layer (for transmission) and in the context of the lower layer (for reception). However, for the TxConfirmation timeout timer a scheduled function is needed.

### IPDUM103:

| Service name: | Ipdum_MainFunction |
|---------------|--------------------|
| •             |                    |

| Syntax:          | void Ipdum_MainFunction(  |
|------------------|---|
| Service ID[hex]: | 0x10  |
| Timing:          | FIXED_CYCLIC_WITH_PRECONDITION  |
|                  | Performs the processes of the activities that are not directly initiated by the calls from PDU-R. |

**IPDUM101:** The function Ipdum\_MainFunction shall perform the processing of the IpduM activities that are not directly initiated by the calls from PDU-R. This includes at least the TxConfirmation time observation.

**IPDUM072:** The configuration of the BSWM Scheduler shall be such that the cycle time is equal to the smallest IpduMTxConfirmationTimeout.

# 8.6 Expected Interfaces

In this chapter, all interfaces required from other modules are listed.

### 8.6.1 Mandatory Interfaces

This chapter defines all interfaces that are required to fulfill the core functionality of the module.

#### **IPDUM104:**

| API function             | Description                           |
|--------------------------|---------------------------------------|
| PduR_lpdumTxConfirmation | Tx confirmation for the IPDUM         |
| PduR_lpdumTransmit       | Requests a transmission for the IPDUM |
| PduR_lpdumRxIndication   | Rx indicator for the IPDUM            |

#### 8.6.2 Optional Interfaces

This chapter defines all interfaces that are required to fulfill an optional functionality of the module.

#### IPDUM105:

| API function    | Description                           |
|-----------------|---------------------------------------|
| Det_ReportError | Service to report development errors. |

# 8.6.3 Configurable interfaces

Not applicable

# 9 Sequence diagrams

# 9.1 Transmission of a multiplexed I-PDU and Transmit confirmation

The following sequence chart shows a transmit request initiated by the COM layer. The transmit request is for an I-PDU which has to be transmitted within a multiplexed I-PDU. In the IpduM module is configured that this transmitted I-PDU triggers the sending of the multiplexed I-PDU.

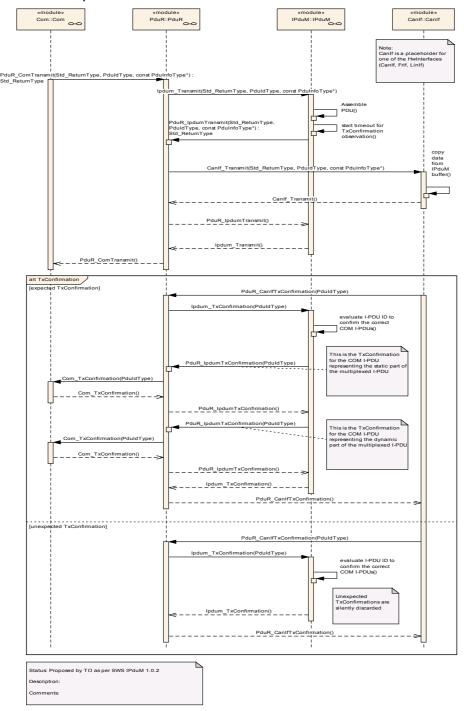

Figure 4 Transmission and confirmation of multiplexed I-PDU with triggering

# 9.2 Transmission of a multiplexed I-PDU without Trigger

The following sequence chart shows a transmit request initiated by the COM layer. Because of the configuration of the IpduM, no transmit request for the IpduM I-PDU takes place. For configuration see <a href="IPDUM052">IPDUM052</a>.

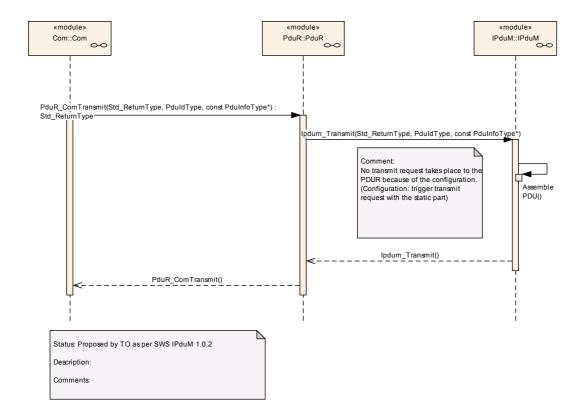

Figure 5 Transmission of a multiplexed I-PDU without triggering

# 9.3 Reception of the multiplexed I-PDU

The following sequence chart shows a reception of a multiplexed I-PDU. The I-PDU contains a static and a dynamic part and both are configured to create an RxIndication to the PDU-R module.

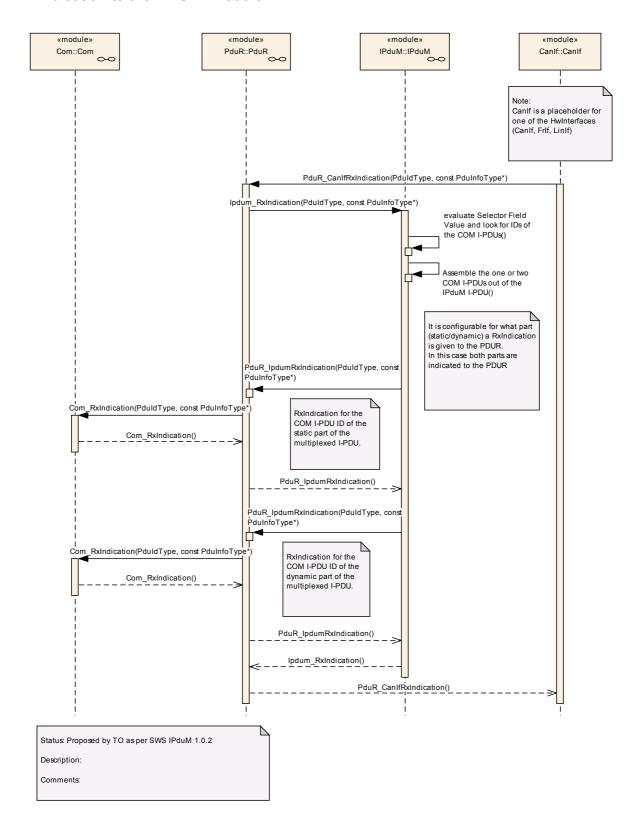

Figure 6 Reception of a multiplexed I-PDU

# 9.4 Trigger Transmit

The following sequence chart shows a Trigger Transmit request from an interface layer.

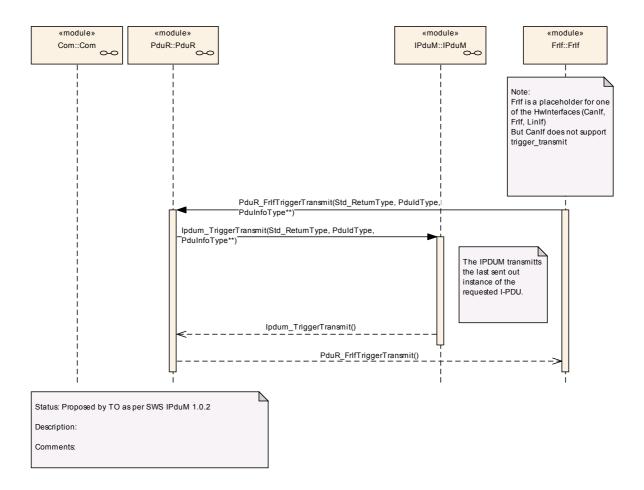

Figure 7 Trigger Transmit request from interface layer

## 9.5 Missing Transmit Confirmation

The following sequence chart shows the case that a TxConfirmation is not received by the IpduM module during the TX Confirmation timeout. After the timeout has elapsed, the I-PDU is allowed to be sent again.

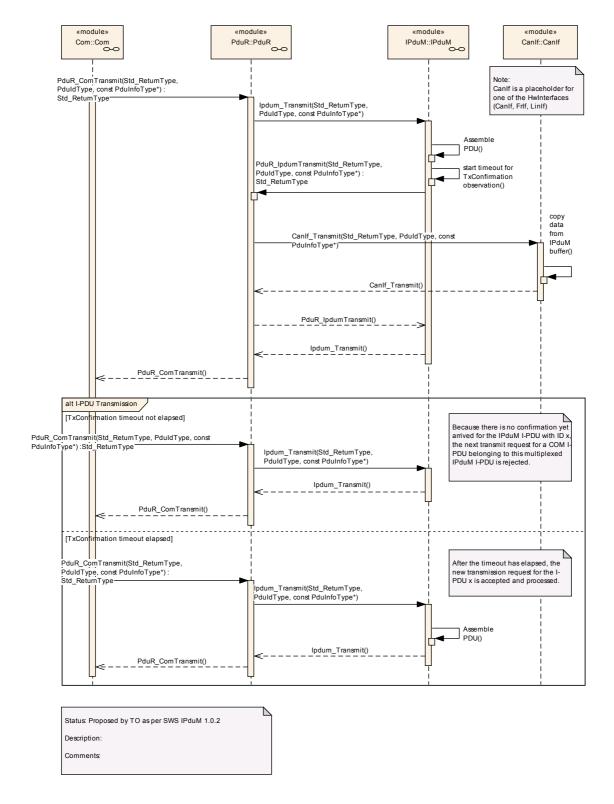

Figure 8 Missing Transmit Confirmation

## 10 Configuration specification

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification Chapter 10.1 describes fundamentals. It also specifies a template (table) you shall use for the parameter specification. We intend to leave Chapter 10.1 in the specification to guarantee comprehension.

Chapter 10.2 specifies the structure (containers) and the parameters of the module lpduM.

Chapter 10.3 specifies published information of the module IpduM.

### 10.1 How to read this chapter

In addition to this section, it is highly recommended to read the documents:

- AUTOSAR Layered Software Architecture [2]
- AUTOSAR ECU Configuration Specification [4]
   This document describes the AUTOSAR configuration methodology and the AUTOSAR configuration Metamodel in detail.

The following is only a short survey of the topic and it will not replace the ECU Configuration Specification document.

#### 10.1.1 Configuration and configuration parameters

Configuration parameters define the variability of the generic part(s) of an implementation of a module. This means that only generic or configurable module implementation can be adapted to the environment (software/hardware) in use during system and/or ECU configuration.

The configuration of parameters can be achieved at different times during the software process: before compile time, before link time or after build time. In the following, the term "configuration class" (of a parameter) shall be used in order to refer to a specific configuration point in time.

#### 10.1.2 Containers

Containers structure the set of configuration parameters. This means:

- *all* configuration parameters are kept in containers.
- (sub-) containers can reference (sub-) containers. It is possible to assign a multiplicity to these references. The multiplicity then defines the possible number of instances of the contained parameters.

## 10.2 Containers and configuration parameters

The following chapters summarize all configuration parameters. The detailed meanings of the parameters describe Chapters 7 and Chapter 8.

#### 10.2.1 Variants

The IpduM module has the following three configuration variants:

- VARIANT-PRE-COMPILE
- VARIANT-LINK-TIME
- VARIANT-POST-BUILD

The VARIANT-PRE-COMPILE is designed to support the use-case where all parameters are fixed at compile-time.

The VARIANT-LINK-TIME is designed for the use case where parameters that affect code generation are fixed at compile-time and all other configuration parameters are fixed at link-time.

The VARIANT-POST-BUILD is designed for parameters that affect code generation to be fixed at compile-time and all other parameters to be fixed at post build-time.

#### 10.2.2 Configuration overview

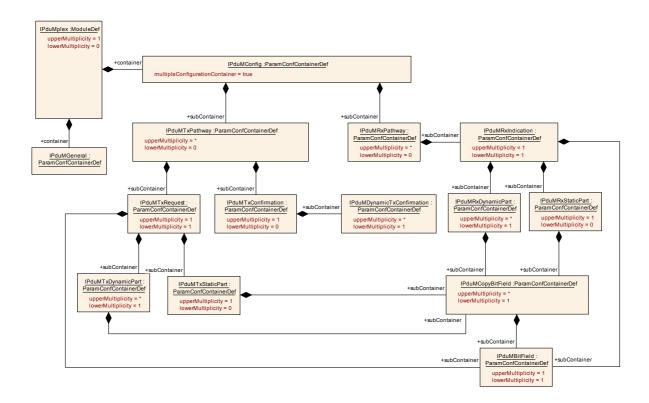

Figure 9 IpduM Configuration Overview

10.2.3 IPduMplex

| Module Name        | IPduMplex   |
|--------------------|---|
| Module Description | Configuration of the IPduMplex (IPdu Multiplexer) module. |

| Included Containers |              |   |  |  |  |
|---------------------|--------------|---|--|--|--|
| Container Name      | Multiplicity | Scope / Dependency  |  |  |  |
| IPduMConfig         | 1            | This container contains the sub containers of the IPduMplex module. The IPduMTxPathway subcontainer includes information about sent I-PDUs. The IPduMRxPathway includes information about received I-PDUs. This container is a MultipleConfigurationContainer, i.e. this container and its sub-containers exist once per configuration set. |  |  |  |
| IPduMGeneral        | 1            | Contains the general configuration parameters of IPduMplex.   |  |  |  |

### 10.2.4 IPduMGeneral

| SWS Item                 | IPDUM130:   |
|--------------------------|---|
| Container Name           | IPduMGeneral Programme                                      |
| Description              | Contains the general configuration parameters of IPduMplex. |
| Configuration Parameters |   |

| SWS Item           | IPDUM131 :             | IPDUM131:                  |                                |  |  |
|--------------------|------------------------|----------------------------|--------------------------------|--|--|
| Name               | IPduMConfigurationTime | IPduMConfigurationTimeBase |                                |  |  |
| Description        | The period between suc | cessive ti                 | cks of AUTOSAR COM in seconds. |  |  |
| Multiplicity       | 1                      | 1                          |                                |  |  |

#### 10.2.6 IPduMTxRequest

|                         | 1  |
|-------------------------|--|
| SWS Item                | IPDUM052:  |
| Container Name          | IPduMTxRequest   |
| Description             | This is used to specify the configuration for Transmit requests. There will one instance of this container for each I-PDU that can be requested for transmission (the outgoing I-PDUs) by the IPduM. |
| Configuration Parameter | ers  |

| SWS Item           | IPDUM162 :   |   |                     |  |
|--------------------|--|---|---------------------|--|
| Name               | IPduMByteOrder   |   |                     |  |
| Description        | This parameter defines the ByteOrder for all IpduMSegments (static and dynamic part) and for the selectorField within the MultiplexedPdu.  The absolute position of a segment in the MultiplexedIPdu is determined by the definition of the ByteOrder parameter: If BIG_ENDIAN is specified, the SegmentPosition indicates the bit position of the most significant bit in an IPDU. If LITTLE_ENDIAN is specified, the SegmentPosition indicates the bit position of the least significant bit in an IPDU. |   |                     |  |

### 10.2.9 IPduMTxConfirmation

| SWS Item                 | IPDUM050:  |
|--------------------------|--|
| Container Name           | IPduMTxConfirmation  |
| Description              | A transmit request can be confirmed by the lower layer. This container is used to generate the matching confirmations for the static and dynamic parts of a multiplexed I-PDU. When an I-PDU is transmitted by the IPduM, the selector field value in that PDU needs to be stored in the IPduM so that the confirmation for the correct dynamic part can be generated. This is state internal to the IPduM at run-time. For the purposes of this container and IPduMDynamicTxConfirmation this stored state is called Stored_Selector. |
| Configuration Parameters |  |

| SWS Item           | IPDUM117:                 | IPDUM117:  |                   |  |  |

10.2.10 IPduMDynamicTxConfirmation

| 10.2.10 ii duliiDyllailiic | i xoonii ination   |
|----------------------------|--|
| SWS Item                   | IPDUM051:  |
| Container Name             | PduMDynamicTxConfirmation  |
| Description                | The dynamic part of an I-PDU can have more than one I-PDU IDs for confirmations. The correct I-PDU ID for the confirmation is found from the selector field value of a previously transmitted I-PDU. It is assumed that this selector field is stored in some internal value called Stored_Selector. When a transmit confirmation is received the Stored_Selector is used to select an instance of IPduMDynamicTxConfirmation by matching the Stored_Selector with the IPduMSelectorValue. |
| Configuration Parameters   |  |

| SWS Item | IPDUM119:   |
|----------|---|
| Name     | IPduMSelectorValue  |

## No Included Containers

10.2.16 IPduMCopyBitField

| TOILITO II Gamoopy Bitt  | 1010   |
|--------------------------|--|
| SWS Item                 | IPDUM053:  |
| Container Name           | IPduMCopyBitField  |
| Description              | Specifies the source bit fields and the destination bit position, so that the bits in the source can be copied to the bits in the destination. Within one I-PDU multiple instances of this container are used to specify the bit fields in that I-PDU. Adjacent bit fields could be merged in order to reduce the number of instances of this container. |
| Configuration Parameters |  |

| SWS Item           | IPDUM114 :                           | IPDUM114:   |                     |  |  |
|--------------------|--------------------------------------|---|---------------------|--|--|
| Name               | IPduMDestinationBit                  |   |                     |  |  |
| Description        |                                      | Bit position in an I-PDU of the start of the destination bit field for the copy. The resulting destination field must fit inside the I-PDU. |                     |  |  |
| Multiplicity       | 1                                    | 1   |                     |  |  |

| Included Containers |              |   |
|---------------------|--------------|---|
| Container Name      | Multiplicity | Scope / Dependency  |
| IPduMBitField       | 1            | This specifies the bits that are reserved for the selector field. |

| Ther | e can only be 18 bits s | pecified. |
|------|-------------------------|-----------|

## 10.2.17 IPduMConfig

| SWS Item                 | IPDUM059:  |
|--------------------------|--|
| Container Name           | IPduMConfig [Multi Config Container]   |
|                          | This container contains the sub containers of the IPduMplex module. The IPduMTxPathway subcontainer includes information about sent I-PDUs.  |
| •                        | The IPduMRxPathway includes information about received I-PDUs.  This container is a MultipleConfigurationContainer, i.e. this container and its sub-containers exist once per configuration set. |
| Configuration Parameters |  |

| Included Containers |              |  |  |  |
|---------------------|--------------|--|--|--|
| Container Name      | Multiplicity | Scope / Dependency                         |  |  |
| IPduMRxPathway      | 0*           | includes information about received I-PDUs |  |  |
| IPduMTxPathway      | 0*           | includes information about sent I-PDUs     |  |  |

#### 10.3 Published Information

Published information contains data defined by the implementer of the SW module that does not change when the module is adapted (i.e. configured) to the actual HW/SW environment. It thus contains version and manufacturer information.

The standard common published information like

```
vendorld (<Module>_VENDOR_ID),
oduleID (<Module>_MODULE_ID),
arMajorVersion (<Module>_AR_MAJOR_VERSION),
arMinorVersion (<Module>_AR_MINOR_VERSION),
arPatchVersion (<Module>_AR_PATCH_VERSION),
swMajorVersion (<Module>_SW_MAJOR_VERSION),
swMinorVersion (<Module>_SW_MINOR_VERSION),
swPatchVersion (<Module>_SW_PATCH_VERSION),
vendorApiInfix (<Module>_VENDOR_API_INFIX)
```

is provided in the BSW Module Description Template (see 3.1 Figure 4.1 and Figure 7.1).

Additional published parameters are listed below if applicable for this module.

# 11 Changes to Release 2.1

Changes made by the SWS improvements of the AUTOSAR Technical Office are marked: "TO SWS".

#### 11.1 Deleted SWS Items

| SWS Item | Rationale  |
|----------|--|
| IPDUM003 | No usage of DEM, since there are no production errors in IpduM |
| IPDUM025 | No usage of DEM, since there are no production errors in IpduM |
| IPDUM031 | No usage of DEM, since there are no production errors in IpduM |
| IPDUM062 | TO SWS: redundant  |
| IPDUM016 | TO SWS: redundant  |
| IPDUM018 | TO SWS: redundant  |
| IPDUM025 | TO SWS: redundant  |
| IPDUM079 | No OS usage is allowed for IpduM                               |
| IPDUM081 | TO SWS: redundant  |

## 11.2 Replaced SWS Items

| SWS Item of Release 1 | replaced by        | Rationale                       |
|-----------------------|--------------------|---------------------------------|
|                       | SWS Item           |                                 |
| IPDUM001              | IPDUM095, IPDUM096 | TO SWS: Made requirement atomic |
| IPDUM012              | IPDUM097 + text    | TO SWS: Made requirement atomic |
|                       | without ID         |                                 |
| IPDUM014              | IPDUM098, IPDUM099 | TO SWS: Made requirement atomic |
| IPDUM036              | IPDUM083, IPDUM084 | TO SWS: Made requirement atomic |

## 11.3 Changed SWS Items

Many requirements have been changed to improve understandability without changing the technical contents. A new configuration variant VARIANT-PRE-COMPILE was added to many requirements in Chapter 10.

| SWS Item | Rationale  |
|----------|--|
| IPDUM032 | added const qualifier  |
| IPDUM040 | harmonized RxIndication APIs within the communication stack    |
| IPDUM043 | harmonized Transmit APIs within the communication stack        |
| IPDUM060 | harmonized TriggerTransmit APIs within the communication stack |

#### 11.3.1 Added SWS Items

| SWS Item | Rationale   |
|----------|---|
| IPDUM083 | clarification on error detection                                  |
| IPDUM084 | separation of requirements  |
| IPDUM085 | TO SWS: Gave ID to requirement out of Ipdum_GetVersionInfo table  |
| IPDUM086 | TO SWS: Gave ID to requirement out of Ipdum_RxIndication table    |
| IPDUM087 | TO SWS: Gave ID to requirement out of Ipdum_TxConfirmation table  |
| IPDUM088 | TO SWS: Gave ID to requirement out of Ipdum_TxConfirmation table  |
| IPDUM089 | TO SWS: Gave ID to requirement out of Ipdum_TriggerTransmit table |
| IPDUM090 | TO SWS: Gave ID to requirement out of Ipdum_TriggerTransmit table |

| IPDUM091        | TO SWS: Gave ID to requirement out of Ipdum_TriggerTransmit table |
|-----------------|---|
| IPDUM092        | clarification of initialization                                   |
| IPDUM101        | TO SWS: Gave ID to requirement out of Ipdum_MainFunction table    |
| IPDUM102        | TO SWS: UML Model linking of Ipdum_Init                           |
|                 |   |
| IPDUM103        | TO SWS: UML Model linking of Ipdum_MainFunction                   |
| IPDUM104        | TO SWS: UML Model linking of mandatory interface                  |
| IPDUM105        | TO SWS: UML Model linking of optional interface                   |
| IPDUM106        | TO SWS: Standard requirement for each module                      |
| IPDUM107        | No direct OS usage allowed for IpduM                              |
| IPDUM108        | updated configuration requirement                                 |
| IPDUM109        | updated configuration requirement                                 |
| IPDUM110        | updated configuration requirement                                 |
| IPDUM111        | updated configuration requirement                                 |
| IPDUM112        | updated configuration requirement                                 |
| IPDUM113        | updated configuration requirement                                 |
| IPDUM114        | updated configuration requirement                                 |
| IPDUM115        | updated configuration requirement                                 |
| <u>IPDUM117</u> | updated configuration requirement                                 |
| <u>IPDUM118</u> | updated configuration requirement                                 |
| IPDUM119        | updated configuration requirement                                 |
| IPDUM120        | updated configuration requirement                                 |
| IPDUM121        | updated configuration requirement                                 |
| IPDUM122        | updated configuration requirement                                 |
| IPDUM123        | Enhanced supported I-PDU size for FlexRay                         |
| IPDUM124        | updated configuration requirement                                 |
| IPDUM125        | updated configuration requirement                                 |
| IPDUM126        | updated configuration requirement                                 |
| IPDUM127        | updated configuration requirement                                 |
| IPDUM128        | updated configuration requirement                                 |
| IPDUM129        | updated configuration requirement                                 |
| IPDUM130        | updated configuration requirement                                 |
| IPDUM131        | updated configuration requirement                                 |
| IPDUM132        | updated configuration requirement                                 |
| IPDUM133        | updated configuration requirement                                 |
| IPDUM134        | updated configuration requirement                                 |
| IPDUM162        | added possibility to configure the byte-order                     |
| IPDUM163        | defined handling of partially received I-PDUs                     |
|                 | _ ' _ ' _ /   |
