Advice for users

AUTOSAR Specification Documents may contain exemplary items (exemplary reference models, "use cases", and/or references to exemplary technical solutions, devices, processes or software).

Any such exemplary items are contained in the Specification Documents for illustration purposes only, and they themselves are not part of the AUTOSAR Standard. Neither their presence in such Specification Documents, nor any later documentation of AUTOSAR conformance of products actually implementing such exemplary items, imply that intellectual property rights covering such exemplary items are licensed under the same rules as applicable to the AUTOSAR Standard.

1 Introduction and functional overview

This document describes the concept, core functionality, optional features, interfaces and configuration issues of the AUTOSAR FlexRay Network Management (FrNm).

The AUTOSAR FlexRay Network Management is a hardware independent protocol that can only be used on FlexRay (for limitations see 4.1). Its main purpose is to coordinate the transition between normal operation and bus-sleep mode of the network.

In addition to the core functionality optional features are provided e.g. to implement a service to detect all present nodes or to detect if all other nodes are ready to sleep.

2 Acronyms, abbreviations and glossary

Acronym:	Description:
CC	Communication Controller
NM	Network Management
WCET	Worst Case Execution Time
DET	Development Error Tracer. AUTOSAR Module for detection and reporting of errors during development.
DEM	Diagnostic Event Manager. AUTOSAR Module which is a sub-component of the diagnostic module within AUTOSAR. It is responsible for processing and storing diagnostic events (errors) and associated freeze frame data. Further, the DEM provides fault information to the DCM (e.g. read all stored DTCs from the error memory).

Abbreviation:	Description:
FrIf	Abbreviation for the FlexRay Interface
FrNm	Abbreviation for the FlexRay specific Network Management
Nmlf	Abbreviation for the generic Network Management

Term:	Definition:
Bus-Sleep Mode	Network mode where all interconnected communication controllers are in the sleep mode.
NM-Network	Instance of the FlexRay NM to handle one physical FlexRay Bus. Caution: The FlexRay Bus contains two channels which cannot be handled independent! Therefore the NM-Network covers both FlexRay bus channels. Equivalent to one NM-Cluster
Network requested	NM network is requested if FrNm_NetworkRequest has been called and neither the network has been released nor Bus Sleep Mode has been entered afterwards
Network released	NM network is released if FrNm_NetworkRelease has been called and network has not been requested afterwards
Repeat Message Request active	A Repeat Message Request is active if FrNm_RepeatMessageRequest has been called or a NM PDU with Repeat Message Request bit set has been received in Network Mode. It is not active anymore if Repeat Message State is left or Bus Sleep Mode is entered.
NM Data Cycle	Number of FlexRay cycles necessary for all nodes to be able to send NM Data at least once.
NM Message	Packet of information exchanged for purposes of the NM algorithm.
NM Repetition Cycle	Number of FlexRay cycles where no change of voting behavior is possible. Value has to be a multiple of the NM Voting Cycle. Used to improve the reliability of the voting.
NM Slot	Slot reserved for purposes of the network management.
NM Timeout	Timeout in the NM algorithm that initiates transition into Bus-Sleep Mode.
NM User Data	Supplementary application specific piece of data that is sent independent of the NM Vote on the bus.
NM Voting	Number of FlexRay cycles necessary for all nodes to be able to vote at least

R3.2 Rev 3

Cycle	once.
NM-Vote	Information transmitted using the FlexRay Bus indicating the vote of a ECU to keep the bus awake
NM-Data	Data related to NM transmitted using the FlexRay Bus.
NM-Cluster	Obsolete, equivalent to NM-Network
ClusterAwake Vote	At least one Node other than itself votes for keeping the cluster awake.

4 Constraints and assumptions

4.1 Limitations

- 1. FlexRay NM can be applied to FlexRay communication systems that support bus sleep mode and that are implemented with appropriate wakeup mechanisms.
- 2. One instance of FlexRay NM can be applied to only one instance of FlexRay Interface within the same ECU.
- One instance of FlexRay NM can be applied to only one FlexRay NM-Cluster in one FlexRay network. One FlexRay NM-Cluster can have only one instance of FlexRay NM.
- 4. FlexRay NM can be applied to both channels of the same FlexRay Bus at the same time.

The Figure 4-1 (unterhalb) presents an AUTOSAR NM stack within an example ECU belonging to a FlexRay NM-clusters.

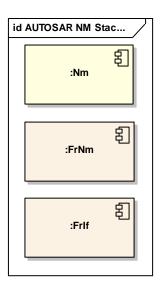

Figure 4-1 AUTOSAR NM Stack on FlexRay

4.2 Applicability to car domains

AUTOSAR NM can be applied to any car domain, wherever FlexRay technology is used, under limitations provided above.

5 Dependencies to other modules

FlexRay NM provides services to the Network Management Interface (NmIf) and uses services of FlexRay Interface

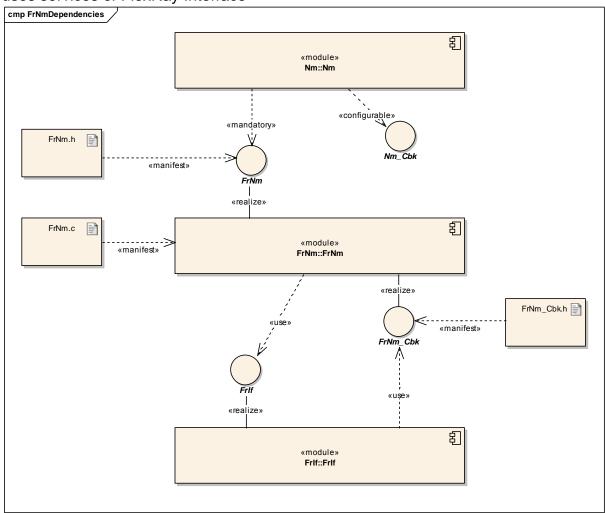

Figure 5-1 NM Overview

Note: In addition to the modules depicted in Figure 5-1 (oben), FlexRay Nm uses some additional modules (like the DET and DEM). A complete list can be found in 5.1.2.

Note: EcuM will be initializing FrNm module

FRNM220: The FlexRay NM shall use only OS objects and/or related OS services according to the table defined in [14] [BSW00429].

5.1 File structure

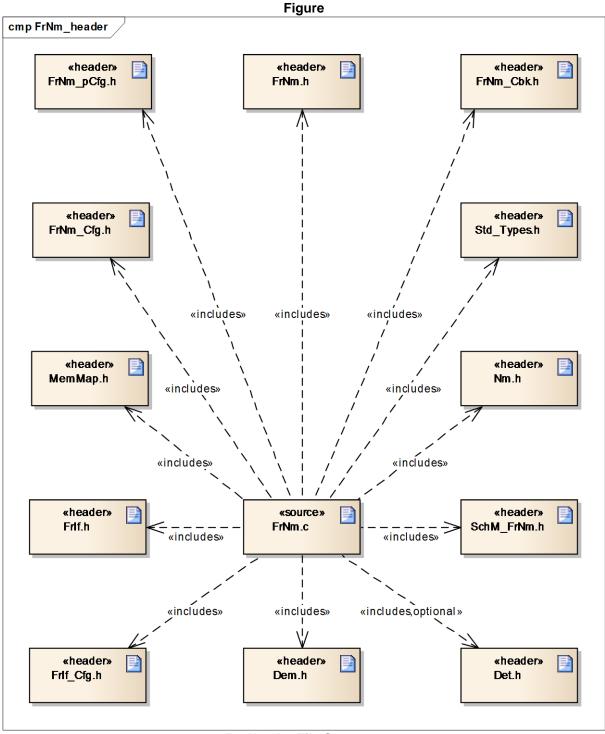

5.1.1 Code file structure

FRNM064: The following source code files shall be provided by the FrNm module.

- FrNm.c (for implementation of provided functionality)
- FrNm_Lcfg.c (for link time configurable parameters)
- FrNm_PBcfg.c (for post build time configurable parameters)

5.1.2 Header file structure

5-2 Header File Structure

FRNM065: The following header files shall be provided and included within the FrNm module.

- FrNm.h (for declaration of provided interface functions)
- FrNm_Cbk.h (for declaration of provided call-back functions)
- FrNm_Cfg.h (for configuration parameters)
- FrNm_pCf.h (for pre-compile time parameters)

R3.2 Rev 3

FRNM066: The following header files shall be included within the FrNm module.

- Std_Types.h (for AUTOSAR standard types Note: Platform_Types.h (for platform specific types) and Compiler.h (for compiler specific language extensions) are indirectly included via AUTOSAR standard types)
- Frlf.h (for interface of FlexRay Interface)
- Nm_Cbk.h (for callbacks of Nmlf)
- Det.h (for interface of DET optional, included only if Det is configured)
- Dem.h (for interface of DEM)
- Nm.h (for common NMIF types)
- SchM_FrNm.h (for interface to Schedule Manager)
- MemMap.h

FRNM070: The following configuration files shall be included within the FRNM module.

- Frlf_Cfg.h (for configuration of FlexRay Interface)
- Det_Cfg.h (for configuration of DET optional, included only if Det is configured)
- Dem_Cfg.h (for configuration of DEM)

Document: AUTOSAR Requirements on Basic Software Modules (NM) [3]

Requirement	Satisfied by
[BSW150] Configuration of functionality	FRNM179, FRNM180, FRNM077,
Note: BSW150 contains a list of requirements which will be	FRNM221, FRNM213, FRNM187
traced in detailed in the following. This entry can be	
used only as overview.	
[BSW151] Integration into running system	FRNM033 together with FRNM175.
	Note: The FlexRay start-up and
	reintegration is handled by the
	ComM and the Frlf. FrNm requires a
	running FlexRay communication
[BSW043] Bus Traffic without NM Initialization	FRNM221
[BSW044] Independency of Underlying Communication System	N/A, FlexRay NM is bus specific
[BSW045] Channel Selective Wake-Up/Shutdown	FRNM034
[BSW046] Trigger of startup of all Nodes at any Point in Time	FRNM168
[BSW047] Bus Sleep and Bus Keep Awake Service	FRNM144, FRNM145
[BSW048] Bus Sleep Mode	FRNM101
[BSW050] Bus State Information	FRNM104
[BSW051] Bus State Change Information	FRNM106
[BSW052] Notification that all other ECUs are ready to sleep	FRNM181
[BSW02509] Notification that at least one other node is not	FRNM185
ready to sleep anymore	
[BSW02503] Sending user data	FRNM043
[BSW02504] Reading user data	FRNM044
[BSW153] Detection of present nodes	OK, see 7.2.3.1
[BSW02505] Sending node identifier	FRNM222
[BSW02506] Reading node identifier	FRNM047
[BSW02511] Configurable Role in Cluster Shutdown	FRNM187
[BSW053] Deterministic Behavior in Case of Bus Unavailability	FRNM035, FRNM223, FRNM224
[BSW137] Communication system error handling	FRNM035
[BSW136] Coordination of coupled networks	N/A, FlexRay NM does not support
	coupled networks.
[BSW140] Compliance with OSEK NM on a gateway	N/A, see NM gateway SWS
[BSW054] Deterministic Time for Bus Sleep	FRNM101
[BSW142] Limitation of NM bus load	OK (limited by configured number of
	NM-messages per FlexRay
	communication cycle)
[BSW143] Deterministic average bus load	OK (guaranteed by the FlexRay
	media access control mechanism)

Specification of FlexRay Network Management V3.4.0

R3.2 Rev 3

[BSW144] ECU cluster size	FRNM179
[BSW145] Robustness against NM message losses	N/A, currently not supported
[BSW146] Robustness against NM message jitter	N/A, FlexRay does not have a
	message jitters.
[BSW147] Processor independent algorithm	FRNM225
[BSW149] Configurable Timing	FRNM036
[BSW154] Bus independency of basic API	FRNM034
[BSW148] Separation of Communication system dependent	N/A, FlexRay NM is bus specific
parts	
[BSW139] Compliance with OSEK NM on one cluster	N/A, see NM gateway SWS
[BSW02510] Immediate Transmission Confirmation	N/A, CAN specific Requirement
[BSW02512] CommunicationControl (28 hex) service support	Not supported
[BSW02508] Unambiguous node identification per bus	FRNM037

7 Functional specification

7.1 Coordination algorithm

The AUTOSAR FlexRay NM is based on a decentralized direct network management strategy, which means that every network node individually performs self-sufficient NM activities self-sufficient based only on the NM-messages that are received or transmitted within the communication system.

The AUTOSAR FlexRay NM coordination algorithm is based on periodic NM-Vote messages received by all nodes in the cluster. Reception of an NM-Vote message indicates that the sending node wants to keep the NM-cluster awake. If any node is ready to go to the Bus-Sleep Mode, it stops sending NM-messages, but as long as NM-messages from other nodes are received, it postpones transition to the Bus-Sleep Mode. Ultimately, if a designated timer elapses because no NM-messages are received anymore, the node initiates transition to the Bus-Sleep Mode.

If any node in the NM-cluster requires bus-communication, it can "wake-up" the NM-cluster from the Bus-Sleep Mode by transmitting NM-Vote messages. For more details concerning the wakeup procedure, please refer to the Mode Management (see [8], [15]).

FlexRay Network Management is responsible for the following functionalities:

- Periodic Update of FlexRay NM-PDU's
- Encoding and Decoding of FlexRay NM-PDU's
- Transmission Error Handling for FlexRay NM-PDU's
- Notification of the Network Management Interface (NmIf) regarding changes of the FlexRay NM state machine

A special case is the possibility to configure the FrNm of a node as "passive". Such a "passive node" will listen to the NM-messages on the FlexRay Bus (to determine whether to stay awake or to go to sleep), but will not send any NM-messages itself. Thus such a node will follow the decisions the network global consensus but will not influence it. A more detailed description of the requirements of passive nodes can be found in chapter 7.8.6 Seite 45).

The main concept of the AUTOSAR FlexRay NM coordination algorithm can be defined by the following key-requirements:

FRNM100: Every network node shall transmit periodic NM-Vote messages as an indication that the node requires bus-communication.

23 of 119

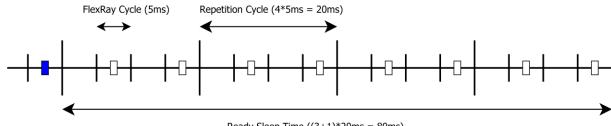

¹ The "wake-up" of the NM-cluster shall not be confused with "wake-up" of the FlexRay cluster, which is not part of the wake-up procedure of the FlexRay NM, as the FlexRay NM requires an already started FlexRay cluster.

FRNM101: If bus communication is released the FlexRay NM module shall perform the transition into the Bus-Sleep Mode at the end of the FrNmReadySleepCnt + 1 repetition cycle without any positive NM vote. The absolute time until transition to Bus-Sleep is therefore given with the formula (FrNmReadySleepCnt +1) * FrNmRepetitionCycle * 'Duration of one FlexRay Cycle' and it starts at the completion of the last repetition cycle containing a positive NM vote.

Example: FrNmReadySleepCnt = 3; Repetition Cycle = 4 FlexRay Cycle; FlexRay Cycle = 5 msec: Ready Sleep Time = $(3+1)^* 4^* 5$ msec = 80 msec.

> Positive NM Vote Negative NM Vote

Ready Sleep Time ((3+1)*20ms = 80ms)

FRNM102: The AUTOSAR FlexRay NM state machine shall contain states. transitions and triggers required for the AUTOSAR FlexRay NM coordination algorithm as seen from the point of view of one single node in the NM-cluster.

FRNM103: Transitions in the AUTOSAR FlexRay NM state machine shall be triggered by calls of selected interface functions or by expiration of internal timers or counters.

FRNM168: The FlexRay NM module shall synchronize state changes in the FlexRay NM state machine to the FlexRay periodic Schedule.

Rationale: The FlexRay NM algorithm is based on the fact that all ECUs, which participate in the FlexRay NM, are synchronized on a global time (based on a periodic repetition of its communication scheme, the so called Cycle - see [4]). To prevent asymmetric behavior of the ECUs (e.g. only a part of the ECUs changes to sleep mode, while the other part stays awake) the FlexRay NM aligns the state changes to a NM Repetition Cycle (which is aligned to a basic FlexRay communication cycle) to guarantee a synchronous behavior of the NM state machines of all ECUs in the NM cluster.

Note: FRNM048 describes on how the implementation will fulfill FRNM168.

7.2 [FRNM462] The FrNm module shall access the FlexRay bus communication cycle via the API Frlf_getGlobalTime|()Operational modes

In the following chapter operational modes of the AUTOSAR FlexRay NM coordination algorithm are described in detail. Figure 7-1 (in chapter 7.4 on page 33) shows the detailed UML state chart of the FlexRay NM.

FRNM105: The AUTOSAR FlexRay NM shall consist of three operational modes:

- Bus-Sleep Mode
- Synchronize Mode
- Network Mode

FRNM106: Changes of the AUTOSAR FlexRay NM operational modes shall be notified by the FlexRay NM module to the upper layer of this module by calling (Nm_StateChangeNotification) callback function.

FRNM311: It shall be configurable with the configuration parameter FrNm_MainAcrossFrCycle if the execution of FrNm_Main function crosses the FlexRay cycle boundary (set to TRUE) or not (set to FALSE). Note: FlexRay NM Vector is available at the end of a FlexRay cycle thus evaluation takes place in the following FlexRay cycle.

Evaluation of the condition RepetitionCycleCompleted shall be evaluated according to the following rules:

If FrNm_MainAcrossFrCycle is FALSE RepetitionCycleCompleted := (CycleNumber % RepetitionCycleLength) = 0

If FrNm_MainAcrossFrCycle is TRUE RepetitionCycleCompleted := (FlexRay "CycleEnd" Event) AND (((CycleNumber – 1) % RepetitionCycleLength) = 0)

Hint: Repetition cycle is completed after we receive all the Votes in the last voting cycle.

Note: CycleNumber stands for the FlexRay communication cycle number whose value is anywhere between 0 and 63 as integers. RepetitionCycleLength is the number of communication cycles within one NM Repetition Cycle. FlexRay "CycleEnd" Event is the event generated at the boundary of two consecutive FlexRay communication cycles.

7.2.1 Bus-Sleep Mode

The Bus Sleep Mode is the default mode on the start of the FrNm State Machine, where it remains unless the NM is started (either with a passive startup request or with a network request) or the power of the CPU is switched off.

In Bus Sleep Mode the communication controller can be switched into the sleep mode where wakeup mechanisms are activated and power consumption is reduced to a minimal level. The corresponding functionality (shut down of FlexRay, power down the CPU) will be implemented in other modules. The FlexRay NM will only signal the readiness for Sleep Mode.

FRNM134: When Bus-Sleep Mode is entered, the FlexRay NM shall notify the upper layer of this module by calling (Nm_StateChangeNotification), except when Bus-Sleep Mode is entered by default at initialization.

Note: The FlexRay NM will notify the ComM via the Generic NM Interface (macro adaptation layer).

FRNM315 When the FrNm module enters the Bus-Sleep Mode, the module shall indicate Nm_BusSleepMode to the upper layer, except when Bus-Sleep Mode is entered by default at initialization.

FRNM137: When the FlexRay NM module has entered the Bus-Sleep Mode the module shall deactivate the transmission of NM-Data and NM-Vote.

FRNM175: When the FrNm module successfully receives a positive Nm vote, and is currently in the Bus-Sleep Mode, it shall notify the ComM via the NmIf module by calling Nm_NetworkStartIndication().

Rationale: <u>FRNM175</u> is required to avoid race conditions and state inconsistency between Network and Mode Management. NM-message reception handling in Bus-Sleep Mode is dependent on the current state of the ECU shutdown/startup process.

Note: The FlexRay NM will notify the ComM via the Generic NM Interface (macro adaptation layer).

FRNM316: BusSleep Mode shall be left and the Synchronize Mode shall be entered if Generic NM Interface calls FrNm NetworkRequest.

FRNM317: BusSleep Mode shall be left and the Synchronize Mode shall be entered if Generic NM Interface calls FrNm_PassiveStartUp.

7.2.2 Synchronize Mode

In the Synchronize Mode the FrNm state machine waits to be synchronized to the FrNm Repetition Cycle. This is necessary as the FlexRay NM is dependent on state changes being synchronized across the NM Cluster.

- FRNM140: When the FlexRay NM module has entered the Synchronize Mode, it shall notify the upper layer of this module by calling (Nm_StateChangeNotification) when the configuration parameter FrNmStateChangeIndicationEnabled is configured as true.
- **FRNM143**: The FlexRay NM module shall leave the Synchronize Mode and enter the Network Mode at the first boundary between two NM Repetition Cycles.
- **FRNM308**: When the FlexRay NM module enters the Synchronize mode, it shall deactivate the transmission of NM-Data and the Node shall not vote for keeping the cluster awake (send "negative" NM-Votes).
- **FRNM340:** If FlexRay NM is in Synchronize state and FlexRay NM receives the indication FrNm_StartupError and if the network is requested, then FlexRay NM shall remain in Synchronize state.
- **FRNM376:** If FlexRay NM is in Synchronize state and FlexRay NM receives the indication FrNm_StartupError and if the network is released, then FlexRay NM shall perform a transition to Bus Sleep State.

7.2.3 Network Mode

- **FRNM107:** The Network Mode of the FlexRay NM module shall consist of three internal states:
 - Repeat Message State
 - Normal Operation State
 - Ready Sleep State

FRNM115: The FlexRay NM module shall synchronize all state changes into and within the Network Mode to the boundary between two NM Repetition Cycles.

Rationale: The FlexRay NM defines a number of FlexRay cycles as NM Repetition Cycle to improve the reliability of the NM vote transmission. Within a NM Repetition Cycle the NM is not allowed to change the NM-vote. For details see chapter 7.9 Seite 53.

FRNM108: When the FlexRay NM module has entered the Network Mode, it shall enter the Network Mode internal state Repeat Message.

FRNM110: When the FlexRay NM module has entered the Network Mode, it shall notify the upper layer of this module by calling (Nm_StateChangeNotification).

[FRNM453]: When the FrNm module has entered the Network Mode, it shall notify the Generic NM Interface module by calling Nm_NetworkMode ()

FRNM307:The FlexRay NM module shall leave the Network mode immediately if the function **FrNm Init** is called.

7.2.3.1 Repeat Message State

For nodes that are not configured as passive the Repeat Message State ensures, that any transition from Bus-Sleep to the Network Mode becomes visible to the other nodes on the network. Additionally it ensures that any node stays active for a minimum amount of time. Optionally it can be used for detection of present nodes (see explanation in chapter 7.8.3).

FRNM116: When the FlexRay NM module has entered the Repeat Message State it shall activate the transmission of NM-Data if the node is configured for NM-Data transmissions and the node shall vote to keep the cluster awake if the node is configured to permit voting.

FRNM117: When the FlexRay NM module has entered the Repeat Message State it shall start the NM Repeat Message Timer (time is configurable by parameter FrNmRepeatMessageTime).

FRNM120: The FlexRay NM module shall leave the Repeat Message State if the NM Repeat Message Timer has expired. During this transition it shall clear the Repeat Message Request Bit.

Note: This transition takes place at a repetition cycle boundary as FrNmRepeatMessageTime is an integer multiple of one repetition cycle.

- **FRNM121**: When the FlexRay NM module leaves the Repeat Message State (see FRNM120) it shall enter the Normal Operation State if the network is requested..
- **FRNM122**: When the FlexRay NM module leaves the Repeat Message State (see FRNM120) it shall enter the Ready Sleep State if the network is released.
- **FRNM384:** If FlexRay NM is in Repeat Message State and global time could not be retrieved, then FlexRay NM shall perform a transition to Synchronize state.

7.2.3.2 Normal Operation State

The Normal Operation State ensures that any node can keep the NM-cluster awake as long as the network is requested.

Note: This State will not be reached if the node is configured as "passive node" (<u>FRNM187</u>). It is up to the implementation to optimize this state and remove the code corresponding to this state.

- **FRNM123**: When the FlexRay NM module enters the Normal Operation State, it shall activate the transmission of NM-Data and the Node shall vote for keeping the cluster awake (send "positive" NM-Votes).
- FRNM124: The FlexRay NM module shall leave the Normal Operation State and enter the Repeat Message State if a Repeat Message Request is active and if a Repetition Cycle is completed. During this transition it shall set the Repeat Message Request Bit if the Repeat Message Request is active due to a call of FrNm RepeatMessageRequest.
- **FRNM125**: The FlexRay NM module shall leave the Normal Operation State and enter the Ready Sleep State if no Repeat Message Request is active and the network has been released and if a Repetition Cycle is completed.
- **FRNM342:** If FlexRay NM is in Normal Operation state and FlexRay NM cannot retrieve global time, then FlexRay NM shall perform a transition to Synchronize state.

7.2.3.3 Ready Sleep State

The Ready Sleep State ensures that any node in the NM-cluster waits to transition to the Bus-Sleep Mode as long as any other node keeps the NM-cluster awake.

- **FRNM126**: When the FlexRay NM module enters the Ready Sleep State, it shall deactivate the transmission of NM-Data and the Node shall not vote for keeping the cluster awake (send "negative" NM-Votes).
- FRNM129: The FlexRay NM module shall leave the Ready Sleep State (and the Network Mode) and enter the Bus-Sleep Mode at the end of the FrNmReadySleepCnt +1 NM Repetition Cycle without any positive NM-Votes.
- FRNM130: The FlexRay NM module shall leave the Ready Sleep State and enter the Repeat Message State at the end of a NM Repetition Cycle if Ready Sleep Time has not expired and a Repeat Message Request is active. During this transition it shall set the Repeat Message Request Bit if the Repeat Message Request is active due to a call of FrNm_RepeatMessageRequest..
- FRNM131: The FlexRay NM module shall leave the Ready Sleep State and enter the Normal Operation State at the end of a NM Repetition Cycle if Ready Sleep Time has not expired and no Repeat Message Request is active and the network has been requested.

Note: A local request to keep the network awake (i.e., Network Request) will be Ignored in the Ready Sleep State in the last Repetition Cycle where sleep shall be entered due to FRNM129.

FRNM444: If FlexRay NM is in Ready Sleep state, the configuration parameter **FRNM_CYCLE_COUNTER_EMULATION** is set to FALSE, global time cannot be retrieved and network is requested again then FlexRay NM shall perform a transition to Synchronize state.

FRNM338: If FlexRay NM is in Ready Sleep state, the configuration parameter **FRNM_CYCLE_COUNTER_EMULATION** is set to FALSE, network is still not requested and on reception of **FrNm_StartupError** the FlexRay NM shall perform a transition to Bus Sleep state.

FRNM378: If FlexRay NM enters Ready Sleep state and the configuration parameter **FRNM_CYCLE_COUNTER_EMULATION** is set to TRUE, the FlexRay NM shall provide a mechanism that detects the repetition cycle end independently from the global time.

Note: FRNM378 could be fulfilled e.g. by a timer or counter which duration fits to one repetition cycle. As long as global time can be retrieved this timer or counter could be synchronized to the exact timing.

FRNM379: If FRNM_CYCLE_COUNTER_EMULATION is set to TRUE and the FlexRay Global Time could not be retrieved, every time the timer

FrNm_SyncLossTimer expires, the FrNm shall count this as one NM Repetition Cycle without any positive vote.

ΔUT SAR

7.3 Network states

Network states (i.e. 'requested' and 'released') are two additional "states" of the AUTOSAR FlexRay NM state machine that exist in parallel to the state machine described in chapter 7.4.

Network states distinguish whether the software components need to communicate on the bus (the network state is then 'requested'); or not (the network state is then 'released'). Note that if the network is released an ECU may still communicate because at least one other ECU still requests the network.

This network states reflect the demand of an upper layer (e.g. ComM) on keeping the bus awake (network requested); or not (network released).

7.4 UML State Chart Diagram

The Figure 7-1 shows an UML state diagram with respect to the API specification.

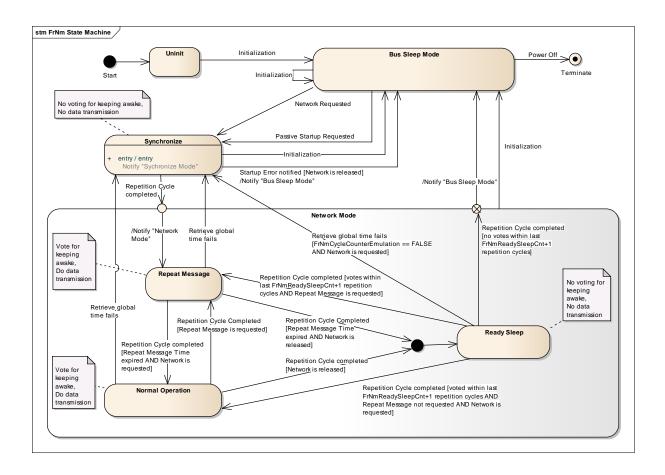

Figure 7-1 UML State Chart

7.5 Initialization and Startup

FRNM071: The FlexRay NM module shall store the initialization status in a private variable.

FRNM072: After a reset, the FlexRay NM module shall set the initialization status to **NM_UNINIT**.

FRNM029: The FlexRay NM module's environment shall initialize the FlexRay NM module after the corresponding FlexRay Interface is initialized and before any other FlexRay NM service is called.

FRNM136: FlexRay NM shall set the flag FrNm_NetworkRequest to FALSE after initialization

7.6 Communication

Using NM-Messages FlexRay NM provides mechanisms for information exchange for purposes of shutdown coordination. These messages are sent according to the schedule configured within each ECU and coordinated across the NM Cluster.

7.6.1 General requirements

For every node the Frlf shall be configured to receive all NM vote messages that are not aggregated by the FlexRay controller.

Note: FlexRay supports an automatic aggregation of Network Management data – called Network Management Vector (see chapter 9.3.3.4 Network management service, page 209, of the FlexRay protocol specification [4]).

This NM-Vector is calculated by the FlexRay Controller by exchanging the NM-Vector in selected network management enabled frames within the static segment of the communication cycle. Every node may be configured to send one NM-Vector in one of its send slots.

Throughout each communication cycle the FlexRay communication controller will maintain an aggregated network management vector by applying a bit-wise OR between each received Network Management Vector (regardless of whether the frame is subscribed to a receive buffer).

This method is a powerful way to receive the NM-Vector of nodes on the network without involving the CPU, but requires at least one send-slot for every node (participiating in the Network Management) in the static segment.

FRNM058: The FlexRay NM decisions shall be influenced by every received NM-Vote and every NM-Vote aggregated by the FlexRay controller.

FRNM205: A FlexRay NM Message shall only contain NM-Vote, NM-Data or both.

FRNM147: The FlexRay NM module shall be able to transmit NM Data and NM Vote separately.

Rationale: The voting algorithm of FlexRay is kept independent of the transmission of the NM data as the FlexRay Protocol provides a HW support for sending and receiving NM votes (see [4]). To use this feature and to increase the update rate of NM-Votes (compared to the update rate of the NM-Data), the transmission of NM-Data and NM-Vote may be separated.

FRNM160: It shall be configurable by the configuration parameter

FRNM_PDU_SCHEDULE_VARIANT which NM-message transmission formats

(NM-Data, NM-Vote and the combined NM-Data/Vote format) are recognized by the FlexRay NM module.

Rationale: The FlexRay NM module must be capable to receive and process the NM-messages which are on the FlexRay bus (FRNM058). To optimize the resource need of the NM it must be configurable which formats are supported by the NM, in order to avoid the overhead of "unused" formats.

FRNM148: Every FlexRay NM node shall be capable to send the NM-Vote in the static or the dynamic segment of the FlexRay bus schedule.

Note: The FrIf configuration is responsible for the actual FlexRay schedule configuration. This requirement is to require that the FrNm will support such a configuration.

FRNM169: Every FlexRay NM node shall be independently configurable the configuration parameter **FrNmHwVoteEnable** _to use the FlexRay NM HW support for receptions of NM-Votes which are transmitted in the static segment.

FRNM151: Every FlexRay NM node shall be capable to send the NM-Data in a static slot or in a dynamic slot.

Note: The Frlf configuration is responsible for the actual FlexRay schedule configuration. This requirement is to require that the FrNm will support such a configuration.

Although it is possible to use multiple FlexRay slots to transmit NM-Data, only one slot should be used in order to limit the number of FlexRay buffers needed for the reception of the NM-Data from different nodes.

7.6.2 FlexRay NM-PDU format

As specified in <u>FRNM147</u> the FlexRay NM is capable to send NM-Vote and NM-Data independently. Therefore several corresponding PDU formats exist for the NM-Vote and for the NM-Data. To also support an associated transmission of NM-Vote and NM-Data in the static segment the NM-Data PDU contains an optional Voting Bit.

7.6.2.1 FlexRay NM-Data PDU format

FRNM006: FlexRay NM-Data PDU format shall be defined as follows:

	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0		
Byte 7	User data 5	User data 5								
Byte 6	User data 4	1								
Byte 5	User data 3	User data 3								
Byte 4	User data 2									
Byte 3	User data 1									
Byte 2	User data 0									
Byte 1	Source Node Identifier									
Byte 0	Blocked Control Bit Vector									

Table 7-1 FlexRay NM-Data PDU Format

- **FRNM076**: The support of the Control Bit Vector for the FlexRay NM module shall be configurable at pre-compile time by the configuration parameter **FrNmControlBitVectorEnabled** (see chapter 10).
- **FRNM222**: The support of the Source Node Identifier for the FlexRay NM module shall be configurable at pre-compile time by the configuration parameter **FRNM_SOURCE_NODE_IDENTIFIER_ENABLED** (see chapter 10).
- **FRNM154**: The length of the NM Data PDU for the FlexRay NM module shall be configurable at pre-compile time to any integer value from 0 to 8 by the configuration parameter **FrNmPduLength** (see chapter 10).
- **FRNM313:** The behaviour of the FlexRay NM module to send NM-Data PDU shall be configurable at pre-compile by the configuration parameter **FRNM NM DATA ENABLED** (see chapter 10).
- **FRNM155**: The difference between applied standardized bytes and NM Data PDU length in the FlexRay NM module shall be user data.
- **FRNM156**: The NM-Data PDU Control Bit Vector of the FlexRay NM module format shall be defined as follows:

	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Byte	Not available	Partial Network Informati on Bit	Res	Active Wakeup Bit	NM Coordina tor Sleep Ready	NM Coordinat or ID (high bit)	NM Coordin ator ID (low bit)	RptMsg Request

Table 7-2 Control Bit Vector Format

FRNM055: The Control Bit Vector of the FlexRay NM module shall contain a Repeat Message Request Bit (RptMsgRequest) with the following meaning:

0: Repeat Message State not requested

1: Repeat Message State requested

The Control Bit Vector of the FlexRay NM module shall contain two NM Coordinator ID Bits (Bit 1, 2: represents the priority of the coordinator)

1: low

2: medium

3: high

The Control Bit Vector of the FlexRay NM module shall contain a NM Coordinator Sleep Ready Bit

0: NM cluster is not ready to sleep

1: All nodes of the NM cluster are ready to sleep

The Control Bit Vector of the FlexRay NM module shall contain an Active Wakeup Bit with the following meaning.

0: Node has not woken up the network

1: Node has woken up the network

The Control Bit Vector of the FlexRay NM module shall contain a Partial Network Information Bit (PNI)

0: NM message contains no Partial Network request information

1: NM message contains Partial Network request information

FRNM213: The support of the Repeat Message Bit for the FlexRay NM module shall be configurable at pre-compile time by the configuration parameter **FrNmRepeatMessageBitEnabled** (see chapter 10).

FRNM157: The FlexRay NM module shall not use Bit 7 of the Control Bit Vector.

Rationale: This bit is used for the NM-Vote when an NM-Data message is sent in the static segment of the FlexRay together with an NM-Vote.

FRNM214: The FlexRay NM module shall set Bit 7 of the Control Bit Vector to 0_b.

Rationale: For processing purpose Bit 7 must be set to a value. The value of 0_b has been chosen as the NM-Vote mechanism uses an OR algorithm where 0_b does not influence the result.

FRNM161: The FlexRay NM module shall set Bit 1 to 6 of the Control Bit Vector to 0_b which are reserved for future extension.

7.6.2.2 FlexRay NM-Vote PDU format

FRNM215: The NM-Vote PDU format of the FlexRay NM module shall be defined as follows:

	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Byte 0	Vote	Not available						

Table 7-3 NM-Vote PDU Format

FRNM216: The NM-Vote PDU format of the FlexRay NM module shall contain a

Voting Bit (Vote) with the following meaning:

0: vote against keeping awake1: vote for keeping awake

FRNM218: The FlexRay NM module shall not use Bits 0-6 of the NM-Vote PDU.

Rationale: Bits 0-6 are used for the Control Bit Vector of the NM-Data PDU when an NM-Data message is sent in the static segment of the FlexRay together with an NM-Vote.

FRNM219: The FlexRay NM module shall set Bits 0-6 of the NM-Vote PDU to 0b.

Rationale: For processing purposes Bits 0-6 must be set to a value. The value of 0_b has been chosen because it does not influence the Control Bit Vector when an OR algorithm is used to overlay the NM-Vote with the Control Bit Vector of the NM-Data PDU.

Rationale: To use the FlexRay NM Vector hardware support the NM Vector has to be placed at the start of the payload of a FlexRay frame (see also [4]). Regardless of whether a given node uses the FlexRay NM-vector hardware support, the node has to place its NM-Vote at this position to support the use of the hardware support by other nodes.

7.6.2.3 Combination of NM-PDUs

When the NM-Vote and NM-Data are combined within one PDU (see chapter 7.9 Seite 53) the content of the NM-Vote will be combined with the content of the Control Bit Vector (CBV) Byte of the NM-Data as shown in Table 7-4 unterhalb. The following requirements specify this combination.

	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
NM-Data PDU - CBV	Not available	Partial Network Informati on Bit	Res	Active Wakeup Bit	NM Coordin ator Sleep Ready	NM Coordin ator ID (high bit)	NM Coordin ator ID (low bit)	RptMsg Request
+								
NM-Vote PDU	Vote	Not available						

Combined CBV and Vote	Vote	Partial Network Informati on Bit	Res	Active Wakeup Bit	NM Coordin ator Sleep Ready	NM Coordin ator ID (high bit)	NM Coordin ator ID (low bit)	RptMsg Request
-----------------------------	------	---	-----	-------------------------	---	--	---------------------------------------	-------------------

Table 7-4 Combined NM-Vote and NM-Data CBV Format

FRNM162: The FlexRay NM module shall combine the NM-Vote PDU Format with the Control Bit Vector Format of the NM-Data PDU in case the FlexRay NM module shall transmit the NM-Vote in the same PDU as the NM-Data.

7.6.3 FlexRay NM-PDU transmission

For the FlexRay NM-PDU transmission both decoupled or immediate buffer access can be used. For more details see FlexRay Interface SWS [7].

7.6.4 FlexRay NM-PDU reception

For the FlexRay NM-PDU reception the FlexRay Reception Indication is used. For more details see FlexRay Interface SWS [7].

7.6.5 Functional requirements on FrNm API

The following requirements define the available FlexRay NM functions.

FRNM037: The set of the Source Node Identifier shall be configurable at pre-compile time by the configuration parameter **FrNmNodeld** (see chapter 10).

7.7 Execution

The FlexRay NM State machine and hence the NM-task execution has to be synchronized with the FlexRay bus schedule (FRNM168). FlexRay NM decisions and state changes have to be aligned to the FlexRay Bus Cycle. To guarantee synchronized state changes and decisions of the FrNm, the FrNM Mainfunction (FrNm_MainFunction_<NmClstldx>) has to be executed within a specific time window as shown in Figure 7-2 (Seite 40). The borders of this window are defined on one side by the availability of all NM-Votes of the actual cycle and on the other side by the last point in time where the own NM-Vote (of the next cycle) has to be sent. As the relative time for a FlexRay cycle may vary due to the FlexRay clock rate correction, and the FlexRay NM algorithm is dependent on the synchronisation to the FlexRay Bus, it is not recommended to use a CPU time service. Instead this can (for example) be achieved by using a AUTOSAR OS Schedule Table which is synchronized to the global (FlexRay) time.

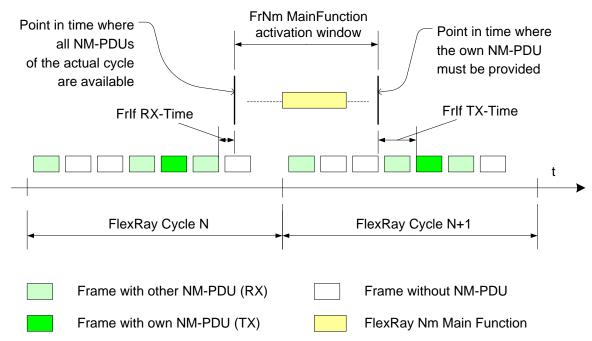

Figure 7-2 FrNm Mainfunction Execution

7.7.1 General requirements

FRNM225: The FlexRay NM module's implementer shall realize the FlexRay NM coordination algorithm processor independent, which means the FlexRay NM coordination algorithm shall not rely on any processor specific hardware support and thus shall be realizable on any processor architecture that is in the scope of AUTOSAR.

FRNM007: The FlexRay NM module's environment should execute the FlexRay NM module (FrNm_MainFunction_<NmClstldx>) at least once a FlexRay communication cycle.

Note: This requirement is a recommendation that need not to be fulfilled in every implementation.

7.7.2 FlexRay NM-Task structure

The FlexRay NM-Task will hold the "automated" functionality of the FlexRay NM - as there are the periodic transmission of NM-Messages, the processing of the received of NM-Messages and periodic processing of the FlexRay NM state machine (at the boundary between two NM-Repetition Cycles).

FRNM010: The FlexRay NM module shall call the FlexRay Interface function **FrIf_Transmit** to transmit NM-Vote and NM-Data if the transmission of cyclic NM-messages is started.

The FlexRay Interface module shall call the FlexRay NM module function FrNm_TxConfirmation if a NM-message is successfully transmitted.

The FlexRay Interface module shall call the FlexRay NM module function FrNm_RxIndication if a NM-message is received.

Note: It is up to the implementation how the data from the NM-message is handled. It can be immediately processed (to reduced the memory consumption), or it can be stored to be available for a later processing (to reduce computing time). However, NM-Votes received in a given cycle must be processed before the node transmits its vote in the subsequent cycle.

7.7.3 FlexRay NM-Task execution

7.7.3.1 Synchronous FlexRay NM-Task execution

FRNM048: The FlexRay NM module integrator shall define a schedule to activate the FlexRay NM task synchronously to the FlexRay communication cycle.

Implementation hint: The execution has to occur at least once within a window starting at the time where all NM-Votes of a vote cycle are available, and ending at the time where the node has to provide its next NM-Vote PDU or the first NM-Vote of the next vote cycle is received, before "repetition cycle completed" occurs. To guarantee synchronous transition into Bus Sleep Mode, the last Nm main task within a vote cycle has to consider the same votes as the last Nm main task of all other nodes."

Rationale: This is necessary because FlexRay NM state changes may influence whether the NM-Vote PDU should be transmitted in the subsequent cycle. Since state changes are influenced by the aggregated NM vote in a given cycle and the state change subsequently influences the NM-Vote, the task must execute in a time window bounded by the cycle end and the transmission slot for the NM-Vote PDU. (FRNM168).

Note: The AUTOSAR OS [14] provides the method of Schedule Tables which can be synchronized with a Global Time. These could be used to fulfill the FlexRay NM execution requirements.

7.7.3.2 Asynchronous FlexRay NM-Task execution

FRNM177: The FlexRay NM module shall not use asynchronous NM-Task activation.

Note: An alternative solution is under investigation which guarantees transition into Bus-Sleep Mode at the same point in time when FlexRay NM task is not properly synchronized with the cycle timing of the FlexRay bus (i.e. within the same FlexRay communication cycle) but no solution has been found yet.

7.8 Additional Features

7.8.1 Cluster size

FRNM179: The AUTOSAR FlexRay NM algorithm shall support up to 64 nodes per NM-Cluster.

Note: The AUTOSAR FlexRay NM algorithm can support an arbitrary number of nodes per NM-cluster (even more than the maximum of 64 nodes per FlexRay cluster). It is only a matter of configuration, since the upper limit is not fixed and depends on the trade off between response time, fault-tolerance and resulted bus load configured for the AUTOSAR FlexRay NM coordination algorithm.

7.8.2 Detection of Remote Sleep Indication (optional)

The "Remote Sleep Indication" signals a situation where a node detects that all other nodes are ready to sleep, but the node where the indication occurs is still keeping the bus awake.

FRNM180: The detection of remote sleep indication by the FlexRay NM module shall be configurable at pre-compile time by the configuration parameter **FrNmRemoteSleepIndicationEnabled** (see chapter 10).

Note: if a node is configured as Passive (<u>FRNM187</u>) the remote sleep indication shall not be used because the node does not vote so it is incapable of being the only node keeping the NM Cluster awake. Consequently the remote sleep indication simply cannot occur.

- FRNM181: If no NM-messages with an indication to keep the bus awake are received in the Normal Operation State for a configurable amount of time determined by the FrNmRemoteSleepIndTime (configuration parameter), the NM shall notify the upper layer of this module that all other nodes in the cluster are ready to sleep (the 'Remote Sleep Indication') by calling _RemoteSleepIndication .
- FRNM186: The FlexRay NM module shall reject a check of Remote Sleep Indication (FrNm_CheckRemoteSleepIndication) when not in Network Mode. The function FrNm_CheckRemoteSleepIndication shall immediately return the value NM_E_NOT_OK and shall not execute any functionality.
- FRNM229: If FlexRay NM module Remote Sleep Indication has been previously detected and if an NM-message with an indication to keep the bus awake is received in the Normal Operation State again, the NM shall notify the the upper layer of this module that some nodes in the cluster are not ready to sleep anymore (the 'Remote Sleep Cancellation') by calling <UL_RemoteSleepCancellation

FRNM230: If Remote Sleep Indication has been previously detected and Repeat Message State is entered from Normal Operation State, the NM shall notify the the upper layer of this module that some nodes in the cluster are not ready to sleep anymore (the 'Remote Sleep Cancellation') by calling <UL_RemoteSleepCancellation

7.8.3 Detection of Nodes (optional)

Nodes which have the Node Detection Feature enabled (<u>FRNM170</u>) will send Identification Data (NM-Data PDU) on the bus (see chapter 7.6.2) if in the Repeat Message State (see chapter 7.2.3.1) or the Normal Operation State. This data can be received by other nodes using the FrNm_GetNodeIdentifier function.

A node can identify (detect) nodes on the FlexRay Bus by repeated calling of the previous mentioned function.

To ensure that all nodes (which are configured to do so) will send their Identification Data the FrNm_RepeatMessageRequest can be used to bring all nodes to the Repeat Message State.

FRNM170: The support of node detection for the FlexRay NM module shall be configurable at pre-compile time by the configuration parameter FrNmNodeDetectionEnabled (see chapter 10).

FrNmSourceNodeIdentifierEnabled have to be also on.

7.8.4 User data (optional)

FRNM077: The support of user data for the FlexRay NM module shall be configurable at pre-compile time by the configuration parameter **FrNmUserDataEnabled** (see chapter 10).

FRNM447: When FrNm_SetUserData is called the FrNm module shall set the Network Management user data for the Network Management PDUs transmited next on the bus.

Alternatively to the usage of the FrNm APIs to set and get user data, FrNm may use the COM to retrieve its user data.

FRNM446: If FrNmComUserDataSupport is enabled the API FrNm_SetUserData shall not be available.

FRNM364 If FrNmComUserDataEnabled is set to TRUE the FrNm shall collect the NM User Data from the referenced NM I-PDU by calling PduR_FrNmTriggerTransmit and combine the user data with the further NM bytes each time before it requests the transmission of the corresponding NM message.

FRNM394 If FrNmComUserDataEnabled is set to TRUE FrNm shall call PduR_FrNmTriggerTransmit within the function FrNm_TriggerTransmit called by the Frlf.

AUT O SAR

FRNM365 If FrNmComUserDataEnabled is set to TRUE the FrNm shall call PduR_FrNmTxConfirmation within the message transmission confirmation function FrNm_TxConfirmation called by the Frlf.

FRNM366 If **FrNmComUserDataEnabled** is set to TRUE then the FrNm implementation shall provide an API **FrNm_Transmit** (see FRNM401). **FrNm_Transmit** shall be an empty function returning E_NOT_OK at any time as an additional asynchronous message transmission is not possible on FlexRay.

Hint: NM user data is handled by a SW-C like a "normal signal". User data consistency is guaranteed even if more than one SWC send user data. Relocation of a SW-C / VFB concept supported.

Hint: SW-C sends a signal containing user data, RTE propagates signal to COM, COM have to be configured that all user data signals of a channel are aggregated in one IPDU. Send type of that IPDU have to be configured "NONE" (-> COM never sends this signal)

Note: Missing abstraction of user data content and structure (length and structure of NM user data is OEM specific

7.8.5 NM Data (optional)

FRNM321: The support for NM data in the FrNm module shall be configurable at precompile time by the configuration parameter **FrNmNmDataDisabled**. If data needs to be enabled then **FrNmNmDataDisabled** will be set to FALSE, otherwise it will be set to TRUE.

7.8.6 Passive Node Configuration (optional)

Nodes that are configured "Passive" Mode participate in the cluster NM only in a passive way. They only receive NM-Votes, but do not transmit votes to keep the cluster awake. Such a passive node never changes to the Normal Operation State (in the State Machine). It would be a configuration error if the ComM would call the Nm_NetworkRequest for such a node.

FRNM187: The Passive Node Configuration shall be configurable at pre-compile time by the configuration parameter **FRNM_PASSIVE_MODE_ENABLED** (see chapter 10).

FRNM188: If Passive Node Configuration is enabled (<u>FRNM187</u>), the FlexRay NM module shall not use the Remote Sleep Indication options (FRNM180).

Note: Configuration parameter FrNmRemoteSleepIndicationEnabled shall be set to false.

7.8.7 NM PDU Rx Indication (optional)

The PDU Rx Indication could be used by the upper layers to detect NM acitivity (reception of a NM-Vote, NM-Data or combined NM-Data/Vote PDU) on the FlexRay

R3.2 Rev 3

bus. However, since a lot of NM PDUs will be received, especially when using the static segment for PDU transmission, it is not recommended to use this service.

FRNM189: The NM PDU Reception indication shall be configurable at pre-compile time by the configuration parameter FrNmPduRxIndicationEnabled (see chapter 10).

FRNM190: If NM PDU Reception indication is enabled (<u>FRNM189</u>), the FlexRay NM module shall call the function NM_PduRxIndication at the successful reception of an NM-PDU.

7.8.8 State change notification (optional)

FRNM191: The optional state change notification service shall be configurable at precompile time by the configuration parameter FrNmStateChangeIndicationEnabled (see chapter 10).

FRNM192: If the optional state change notification service is enabled (FRNM191), the FlexRay NM module shall notified all state changes of it to the upper layer of this module by calling (Nm StateChangeNotification).

7.8.9 Dual Channel PDU support (optional)

As described in more detail in 7.9, the FlexRay NM shall support the send and transmit of PDU on both FlexRay channels (A and B). For the static segment this feature is supported by the Frlf, where for the dynamic segment this feature must be provided by the FlexRay NM itself, by sending (and receiving) two PDUs (one for channel A and one for channel B). The following requirements describe the required functionality.

FRNM231: The dual channel PDU support of the FlexRay NM shall be statically configurable at pre-compile time by the configuration parameter FrNmDualChannelPduEnable (see chapter 10).

7.8.10 Car Wakeup (optional)

FRNM402 The position of the CWU bit in NM messages shall be defined by FrNmCarWakeUpBytePosition and FrNmCarWakeUpBitPosition.

Rx Path

FRNM410 If the car wakeup bit within any received NM-PDU is 1 and FrNmCwuRxEnabled is TRUE, FrNm shall call Nm CarWakeUpIndication and perform the standard Rx indication handling.

FRNM411 If FrNm_GetPduData is called in the context of Nm_CarWakeUpIndication, FrNm shall return the PDU data of the PDU that causes the call of Nm CarWakeUpIndication.

Note: This is required to enable the ECU to identify detail about the sender of the car wakeup request.

FRNM412 If FrNmCarWakeUpFilterEnabled is TRUE, the car wakeup bit within any received NM-PDU is 1, FrNmCwuRxEnabled is TRUE and the Node ID in the received NM-PDU is equal to FrNmCarWakeUpFilterNodeId the FrNm module shall call Nm CarWakeUpIndication and perform the standard Rx Indication handling.

Note: The car wakeup filter is necessary to realize sub gateways that only consider the car wakeup of the central Gateway to avoid wrong wakeups.

Tx Path

The transmission of the car wakeup bit shall be handled by the application using the NM user data mechanism provided by the FrNm module.

7.8.11 NM coordinator synchronization support (optional)

The network management stack allows to have a coordinated shutdown of more than one bus if an ECU exists which is connected to the busses which are to be coordinated. The main functionality is included in the Nmlf module.

FRNM447 This feature shall only be available if **FrNmCoordinatorSyncSupport** is set to TRUE.

FRNM463 If FrNm has entered Network Mode and shall notify the NmIf by calling $Nm_CoordReadyToSleepIndication$ on the first reception of a NM message with the with the NmCoordinatorSleepReady bit (see CBV) set to 1.

Note: This API is only called from the FrNm by the Rx Indication function.

FRNM446 The **NMcoordinatorSleepReady** bit in the Control Bit Vector shall be set via the API **FrNm_SetSleepReadyBit**.

FRNM460 If FrNm called Nm_CoordReadyToSleepIndication and is still in Network Mode it shall notify the NmIf by calling Nm_CoordReadyToSleepCancellation on the first reception of a NM message with the NmCoordinatorSleepReady bit (see CBV) set to 0

7.8.12 Extension for Partial Network

To reduce the power consumption of communication domains, it shall be possible to switch off the communication stack of ECUs during active bus communication. To

control the shutdown and wakeup of these ECUs (cluster) in a standardized way, the AUTOSAR Network Management shall be used. Thus the AUTOSAR FrNm must be extended by the following Features.

Note: It is not possible to switch of only one ECU in a FlexRay cluster.

FRNM405The FrNm extensions for partial networking are enabled with the configuration switch FrNmPnEnabled.

FRNM404 FrNm shall be able to distinguish between an NM PDU without PN request information and an NM PDU with PN request information contained in the NM user data. This is indicated by Partial Network Information Bit (PNI) (PNI) in the CBV of the NM PDU.

Meaning of the PNI bit:

0 -> NM PDU contains no PN request information

1 -> NM PDU contains PN request information

[FRNM456] [The range of the PN request information in the NM user data is defined by the parameters FrNmPnInfoOffset and FrNmPnInfoLength. Each bit in the PN range shall have the following meaning:

Bit value Meaning:

0 -> The PN is not requested

1 -> The PN is requested]_()

Note: FrNmPnInfoOffset + FrNmPnInfoLength shall not exceed the Length of the NM PDU.

FRNM418By means of the configuration parameter FrNmPnFilterMaskByte the FrNm is able to detect which PN request information is relevant for the ECU and which not. Each bit of FrNmPnFilterMaskByte has the following meaning:

0 -> The PN request information is irrelevant for the ECU.

1 -> The PN request information is relevant for the ECU.

FRNM416The PN filter mask FrNmPnFilterMaskByte shall be a byte array with the length of FrNmPnInfoLength.

FRNM420If at least one bit within the PN request information Range of the received NM-PDU (defined by the parameters FrNmPnInfoOffset and FrNmPnInfoLength) matches with the corresponding bit in the PN filter mask, the PN request information is relevant for the ECU.

7.8.12.1 RX-Path

FRNM406If FrNmPnEnabled is FALSE, FrNm shall perform the standard FrNm RxIndication.

FRNM407If FrNmPnEnabled is TRUE and the PNI bit in the NM PDU provided by FrNm_RxIndication() has the value 0, FrNm shall perform the standard FrNm RxIndication.

FRNM408If FrNmPnEnabled is TRUE and the PNI bit in the NM PDU provided by FrNm_RxIndication() has the value 1, FrNm module shall process the Partial Networking Information of the NM-PDU as described in chapter 7.8.12.3 Aggregation of internal and external requested PNs and 7.8.12.4 Aggregation of external requested PNs

7.8.12.2 TX-Path

FRNM409If FrNmPnEnabled is TRUE, FrNm shall set the value of the PNI bit to 1 in transmitted NM PDUs.

Note: If partial networking is used on the ECU, this ECU always has to send Partial Network information in its NM user data.

[FRNM457] If FrNmPnEnabled is FALSE, FrNm shall set the value of the PNI bit to 0 in transmitted NM PDUs. ()

7.8.12.3 Aggregation of internal and external requested PNs

This feature is used by every ECU that has to switch on/off Pdu-Groups because of the activity of partial networks. (e.g. to prevent false timeouts). The Pdu-Groups shall be switched on if the corresponding PN is requested internally or externally. The Pdu-Groups shall be switched off not until all internal and external requests for the corresponding PN are released. The FrNm only provides the information if the PN is internally/externally requested or not. The logic for switching the Pdu-Groups shall be implemented by an upper layer.

- [FRNM458] If FrNmPnEiraCalcEnabled is TRUE, FrNm shall calculate the aggregation of external and internal PN requests information. ()
- **FRNM413**If FrNmPnEiraCalcEnabled is FALSE, FrNm shall skip the aggregation of external and internal PN requests information.

The aggregated state of the internal/external requested PNs is called External Internal Requests Aggregated (EIRA).

- **FRNM421**The EIRA shall have the size of FrNmPnInfoLength and shall be initialized with the value 0 (not requested) for every PN request bit.
- **FRNM422**The FrNm shall only consider the PN request bits in the NM PDUs that are relevant for the ECU (defined by PN filter mask). All other PN request bits shall be ignored. Thus the EIRA only contains those PN requests, which are relevant for the ECU.
- **FRNM423**If a NM-PDU is received, the FrNm shall set for every requested and relevant PN request the corresponding EIRA bit to 1.

R3.2 Rev 3

FRNM424If a NM PDU is send by the FrNm, FrNm shall set every PN request bit in the EIRA to 1 that is also requested in its transmitted NM PDU.

FRNM425FrNm shall provide an EIRA reset timer for every PN request bit together for all physical FlexRay channels.

Note: This means, only one timer is required to handle one PN on multiple connected physical channels. For example: only 8 EIRA reset timers are required to handle the requests of a Gateway with 6 physical channels and 8 partial networks.

This is possible because the external request is mirrored back to the requesting bus and provided to all other (required) physical channels. Thus it is not required to detect the physical channel that is the source of the request bit.

The EIRA timers should be handled within one of the channel specific main functions e.g. the first one.

FRNM426If a NM-PDU is received, the FrNm module shall restart the EIRA reset timer for every PN request bit that has been requested in the received NM-PDU with FrNmPnResetTime.

FRNM427If a NM-PDU is send by the FrNm, the FrNm module shall restart the EIRA reset timer for every PN request bit that has been requested in its transmitted NM PDU with FrNmPnResetTime.

Note: FrNmPnResetTime should be configured to a value greater than FlexRay NM

Rational: If FrNmPnResetTime is configurd to a value smaller than FlexRay NM cycle time and only one ECU requests the PN, the request state toggles in the EIRA because request state is rested before the requesting ECU is able to send the next NM message.

FRNM428If an EIRA reset timer expires, the FrNm module shall set the corresponding EIRA PN request bit to 0.

FRNM429If the content of EIRA changes (any bit changes from 1 to 0 or from 0 to 1) because of a received or transmitted NM PDU or an EIRA reset timer expiration. FrNm shall inform the upper lavers PduR FrNmRxIndication(). By means of the Rx Indication function the EIRA data shall be provided to the COM module.

7.8.12.4 Aggregation of external requested PNs

Note: This feature is used by the Gateways to collect **only the external** PN requests. The external PN Requests are mirrored back to the requesting bus and provided to other (required) physical channels in Case of Central-Gateway. In Case of a Sub-Gateway the requests bit mustn't be mirrored back to the requesting physical channel to avoid static waking between Central-Gateway and Sub-Gateways. This logic shall be implemented by an upper layer (e.g.:ComM). The FrNm only provides the information if the PN is externally requested or not. The COM is used for data transmission to the upper layer.

- **FRNM430**If FrNmPnEraCalcEnabled is TRUE, FrNm shall calculate the aggregation of external PN requests information.
- **FRNM431**If FrNmPnEraCalcEnabled is FALSE, FrNm shall skip the aggregation of external PN requests.

The aggregated state of the external requested PNs is called "External Requests Aggregated" (ERA).

- **FRNM432**The ERA module shall have a size of FrNmPnInfoLength and shall be initialized with value 0 (not requested) for every PN request bit.
- **FRNM433**The FrNm shall only consider the PN request bits in the NM-PDU that are relevant for the ECU (defined by PN filter mask). All other PN request bits are ignored. Thus the ERA only contains those PN requests, which are relevant for the ECU.
- **FRNM434**If a NM-PDU is received the FrNm module shall set every PN request bit in the ERA to 1 that has been requested by the PN request bits of the received NM-PDU.
- **FRNM435**The FrNm module shall provide an ERA reset timer for every PN request bit for every physical Fr channel.

Note: This means, a separate timer is required to handle one PN on multiple connected physical channels. For example: 48 ERA reset timers are required to handle the requests of a Gateway with 6 physical channels and 8 partial networks. It is not possible to combine the reset timer like EIRA timers, because the external request mustn't be mirrored back to the requesting bus by a Sub-Gateway. Thus it is required to detect the physical channel that is the source of the request bit.

FRNM436If a NM PDU is received, FrNm shall start/restart the ERA reset timer for every PN request bit that is requested in the NM PDU with FrNmPnResetTime.

Note: FrNmPnResetTime should be configured to a value greater than FlexRay NM cycle time.

Rational: If FrNmPnResetTime is configurd to a value smaller than FlexRay NM cycle time and only one ECU requests the PN, the request state toggles in the ERA because request state is rested before the requesting ECU is able to send the next NM message.

- **FRNM437**If an ERA reset timer expires, the FrNm module shall set the corresponding ERA PN request bit to 0.
- FRNM438If the content of ERA changes (any bit changes from 1 to 0 or from 0 to 1) because of a received NM PDU or an ERA reset timer expiration, FrNm shall inform the upper layers by calling PduR_FrNmRxIndication(). By means of the Rx Indication function the ERA data shall be provided to the COM module.

7.9 Schedule details

The following sections describe requirements for the scheduling of NM PDUs on the FlexRay bus - for both dynamic segment and static segment.

As mentioned in chapter 7.6 the FlexRay NM is configurable to transmit the NM-Vote and NM-Data in different PDUs. Therefore the FlexRay NM offers six possibilities for the transmission of NM-messages. They are enumerated below and summarized in the subsequent table.

- 1. NM-Vote and NM Data transmitted within one PDU in static segment. The NM-Vote has to be realized as separate bit within the PDU.
- 2. NM-Vote and NM-Data transmitted within one PDU in dynamic segment. The presence (or non-presence) of the PDU corresponds to the NM-Vote
- 3. NM-Vote and NM-Data are transmitted in the static segment in separate PDUs. This alternative is not recommended -→ Alternative 1 should be used instead.
- 4. NM-Vote transmitted in static and NM-Data transmitted in dynamic segment.
- 5. NM-Vote is transmitted in dynamic and NM-Data is transmitted in static segment. This alternative is not recommended -→ Possibility 2 or 6 should be used instead.
- 6. NM-Vote and NM-Data are transmitted in dynamic segment in separate PDUs.
- 7. NM-Vote and a copy of the CBV are transmitted in the static segment (using the FlexRay NM Vector support) and NM-Data is transmitted in the dynamic segment (see chapter 7.6.2.3).

		FlexRay	Segment
		Static	Dynamic
6	NM-Vote	3 and 4	5 and 6
Туре	NM-Data	3 and 5	4,6 and 7
PDU	NM-Vote and NM-Data	1	2
	Combined NM-Vote and CBV	7	-

Table 7-5 Summary of FlexRay PDU schedule alternatives

Note: If the NM-Vote is transmitted in the static segment of the FlexRay schedule (alternative 1,3,4 and 7), the usage of the HW NM-Vector support is possible.

Although every node can be configured independently to one of the above seven options it is beneficial to choose a "common" transmission alternative.

In addition to the above PDU transmission alternatives FlexRay offers two physical channels where data can be transmitted. Frames can be transmitted on Channel A, Channel B or on both Channels. For the dynamic segment a transmission on both channels requires two transmission- and receive-buffers as the FlexRay Protocol does not support shared transmission on Channel A and B in dynamic slots. In this special case the FlexRay NM can be configured to support a double transmit and receive (see 7.8.9).

FRNM233: The schedule variant for the FlexRay NM module shall be statically configurable at pre-compile time by the configuration parameter **FRNM_PDU_SCHEDULE_VARIANT** (see chapter 10).

FRNM234: In case that a combined NM-Vote and CBV is transmitted in static and dynamic segment (option 7 in Table 7-5) the FlexRay NM module shall use the combined NM-Vote and CBV in the static part for evaluation of the NM-Vote.

7.9.1 FlexRay NM Cycle requirements

This section defines the schedule specific requirements that are required for a reliable transmission of FlexRay NM-messages.

FRNM193: The FlexRay NM module's integrator shall define the FlexRay NM Voting Cycle (**FrNmVotingCycle** configuration parameter) as the number of cycles needed to transmit the NM-Vote of every node at least once.

Note: The value of the NM-Voting Cycle is typically determined by the number of cycles needed to transmit the votes of all "dynamic segment voter" nodes. For example, if only one slot in the dynamic segment is used, 3 nodes transmitting in the dynamic segment would require that the Voting Cycle is set to 4 – see also FRNM195, FRNM196 and Figure 10-3 (Seite 118).

FRNM194: The FlexRay NM module's integrator shall define the FlexRay NM Data Cycle (**FrNmDataCycle** configuration parameter) as the number of cycles needed to transmit the NM-Data of every node at least once.

Note: The value of the NM-Data Cycle is typically determined by the number of cycles needed to transmit the NM-Data of all nodes using the dynamic segment. For example, if only one slot in the dynamic segment is used and 5 nodes transmit their NM-Data in the dynamic segment, the NM-Data Cycle is set to 8 – see also FRNM195 and Figure 10-4 (Seite 119).

FRNM195: The FlexRay NM schedule specific cycle configuration parameters **FrNmVotingCycle**, **FrNmDataCycle** and **FrNmRepetitionCycle** shall have a value of 1, 2, 4, 8, 16, 32 or 64.

Rationale: The limitation to the mentioned values is because FlexRay Cycle Multiplexing is used, which is only defined for these values.

FRNM196: The FlexRay NM Repetition Cycle (**FrNmRepetitionCycle** configuration parameter) shall be an integer multiple (including 1) of the NM Voting Cycle (**FrNmVotingCycle**)

Rationale: To improve the reliability of the FlexRay NM, a number of repetitions of the NM Voting Cycle can be used. This will increase the chance that a "keep-awake" vote is not missed (e.g. due to a transmission error). See Figure 10-3 (Seite 118).

7.9.2 NM-Message scheduled requirements

There are no schedule requirements for the FlexRay NM messages. Anyhow it is highly recommended for frames, containing NM information, which are sent in the dynamic segment of the FlexRay Schedule, to choose the first slots in the dynamic segment and to contain only NM information (NM-Vote and/or NM-Data) for the following reasons:

- Bandwidth (if no NM-message is sent less bandwidth is consumed)
- Flexibility (different nodes can send in the same slot but in different cycles)
- Predictability (it is guaranteed that the first slot is transmitted in each cycle)
- Determinism (transmission in the first slot always occurs at the same point in time in reference to the communication cycle start).

7.10 Transmission Error Handling

FRNM035: If periodic NM-message transmission is running and if no NM-message is successfully transmitted within the time interval of FrNmMsgTimeoutTime (configuration parameter), the FlexRay NM shall notify the the upper layer of this module that transmission failure has occurred by calling _TransmissionTimeoutException.

FRNM223: If the FlexRay bus communication of a FlexRay NM cluster has been shut down the corresponding FlexRay NM shall be shut down, by the BSW upper layer which is in control of FrNm.

Rationale: FlexRay NM depends on the availability of the FlexRay communication (via. Frlf) – if the bus has been shut down FlexRay NM cannot react properly.

Note: The phrase "NM cluster" must not be confused with the meaning of "FlexRay channel". The former is a logical unit, where the second is a physical bus interfaces line. FlexRay offers two channels per Communication controller, which are NOT independent, and can therefore not be seen as independent "NM clusters".

FRNM224: If the FlexRay NM module is shut down, it shall set the initialization status to **NM UNINIT**.

7.11 Error classification

FRNM294: Values for production code Event Ids are assigned externally by the configuration of the Dem. They are published in the file Dem_IntErrId.h and included via Dem.h.

FRNM293: Development error values are of type uint8.

FRNM021: The following errors shall be detectable by the FlexRay NM depending on its build version (development/production mode).

Type or error	Relevance	Related error code	Value
API service used without	Development	FRNM_E_UNINIT	01h
module initialization			
API service called with	Development	FRNM_E_INVALID_CHANNEL	02h
invalid channel handle			
API service called with	Development	FRNM_E_INVALID_POINTER	03h
Invalid pointer			
API service called with	Development	FRNM_E_PDU_ID_INVALID	04h
invalid PDU ID as input			
parameter			

7.12 Error detection

FRNM049: The detection of development errors is configurable (*ON / OFF*) at precompile time. The switch **FrNmDevErrorDetect** (see chapter 10) shall activate or deactivate the detection of all development errors.

FRNM056: Development errors shall not be returned by API functions. In case of a development error the corresponding API function shall return **NM E NOT OK**, if applicable.

FRNM057: Production errors shall not be returned by API functions. In case of a production error the corresponding API function shall return **NM E NOT OK**, if applicable.

FRNM050: If DET is enabled and APIs other than FrNm_Init , FrNm_GetVersionInfo or FrNm_GetVersionInfo or FrNm_MainFunction are called when FrNm has not been initialized, then the called function shall return immediately with E_NOT_OK (if the function has a standard return type). Additionally the FrNm module shall report the error code FRNM_E_UNINIT to the Development Error Tracer (SRS_BSW_00407, SRS_BSW_00416, SRS_BSW_00406).

FRNM051: If DET is enabled and the FlexRay NM API service is called with an invalid handle, then the corresponding function shall report FRNM_E_INVALID_CHANNEL error to the Development Error Tracer and it shall return NM_E_NOT_OK.

FRNM295: The detection of production code errors cannot be switched off.

FRNM024: If detection of development errors is enabled by FrNmDevErrorDetect (configuration parameter), then the FlexRay NM module shall made a validity check of input parameters for FlexRay NM API services.

7.13 Error notification

FRNM022: Detected development errors shall be reported to the *Det_ReportError* service of the Development Error Tracer (DET) if the pre-processor switch **FrNmDevErrorDetect** is set (see chapter 10).

FRNM023: Production errors shall be reported to the Diagnostic Event Manager.

Note: The NM-cluster handle is invalid if it is different from the allowed configured values.

Note: Currently no production errors are defined.

7.14 Version check

FRNM074: The FlexRay NM module shall check at pre-compile time if the if version numbers of C- and H-files are identical.

7.15 Send ActiveWakeupBit in CBV

To identify the ECU that awakes the Network, the FrNm shall send an information with every NM message whehter the ECU is responsible for the communication start or has been woken up by the communication. This information is pending until the ECU leaves the "Network Mode".

FRNM297 If the FrNm performs a state change from state Synchronize to state NetworkMode and the previous state change from state Bus Sleep Mode to Syncronize was caused by a call of FrNm_NetworkRequest() (due to an active wakeup) and FrNmActiveWakeupBitEnabled is TRUE, the FrNm shall set the ActiveWakeupBit in the CBV.

FRNM298 If the FrNm module leaves the NetworkMode and FrNmActiveWakeupBitEnabled is TRUE, the FrNm module shall clear th ActiveWakeupBit in the CBV.

8 API specification

FlexRay NM API consists of services that are FlexRay specific and can be called as required.

FRNM034: Each service other than FrNm_Init refers to one NM cluster only.

Note: The phrase "NM cluster" must not be confused with the meaning of "FlexRay channel". The former is a logical unit, where the second is a physical bus interfaces line. FlexRay offers two channels per Communication controller, which are NOT independent, and can therefore not be seen as independent "NM cluster".

The following figure gives an overview of the available API services and interfaces.

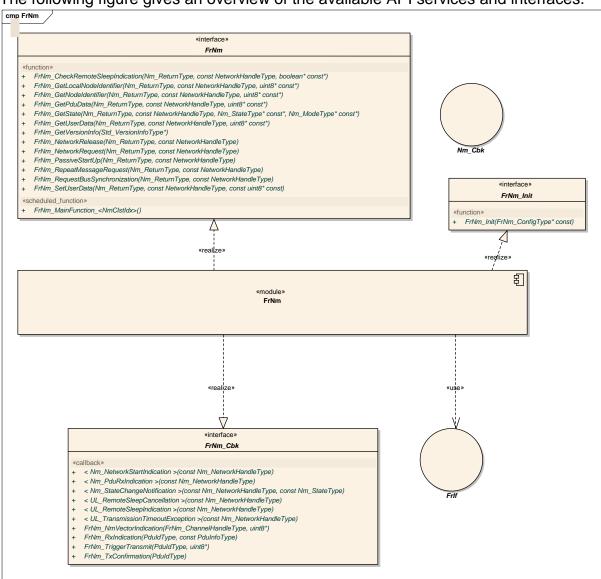

Figure 8-1 API Specification (Overview)

R3.2 Rev 3

8.1 Imported types

In this chapter all types included from the following files are listed:

FRNM235:

Module	Imported Type
ComStack_Types	PduIdType
	PduInfoType
	NetworkHandleType
Dem	Dem_EventIdType
FrIf	FrIf_ConfigType
Nm	Nm_ModeType
	Nm_ReturnType
	Nm_StateType
Std_Types	Std_ReturnType
	Std_VersionInfoType

8.2 Type Definitions

8.2.1 Generic NM Type Definitions

The FlexRay NM will use the type definitions as specified in Specification of Generic Network Management Interface ([6]) in chapter 8.2 Type definitions.

8.2.2 FlexRay NM specific Type Definitions

8.2.2.1 FrNm_ConfigType

Name:	FrNm_ConfigType			
Type:	Structure			
Range:	Implementation specific.			
Description:	Contains configuration parameters.			

For FrNm_ConfigType see chapter 10.5 Seite 103.

R3.2 Rev 3

8.3 Function definitions: FrNm Services provided to upper layers

8.3.1 FrNm_Init

FRNM236:

Service name:	FrNm_Init				
Syntax:	void FrNm_Init(FrNm_ConfigType* const nmConfigPtr)				
Service ID[hex]:	0x00				
Sync/Async:	Synchronous				
Reentrancy:	Non Reentrant				
Parameters (in):	nmConfigPtr Pointer to the selected configuration set.				
Parameters (inout):	None				
Parameters (out):	None				
Return value:	None				
Description:	Initializes the FlexRay NM and its internal state machine.				

FRNM028: The function FrNm_Init shall initialize the FlexRay NM module.

FRNM073: After a successful initialization of the FlexRay NM module, the function FrNm_Init shall set the initialization status to NM_INIT, otherwise to NM_UNINIT.

FRNM059: The function **FrNm_Init** shall select active configuration set provided by means of a configuration pointer parameter.

FRNM030: The function **FrNm_Init** shall deactivate the periodic transmission of NM-Vote and NM-Data after the initialization of the FlexRay NM module (see <u>FRNM100</u>, <u>FRNM137</u>).

FRNM042: After the initialization of the FlexRay NM module the function **FrNm_Init** shall set the Reserved Bytes in the NM-Data and NM-Vote PDU to 0.

FRNM045: After the initialization of the FlexRay NM module the function **FrNm_Init** shall set the User Data bytes to FFh.

8.3.2 FrNm_PassiveStartUp

FRNM237:

Service name:	FrNm_PassiveStartUp			
Syntax:	<pre>Nm_ReturnType FrNm_PassiveStartUp(</pre>			
Service ID[hex]:	0x01			
Sync/Async:	Asynchronous			
Reentrancy:	Non Reentrant			
Parameters (in):	NetworkHandle Identification of the NM-channel			
Parameters (inout):	None			
Parameters (out):	None			
Return value:	Nm_ReturnType			
Description:	Initiates the Passive Startup of the FlexRay NM.			

FRNM258: The function FrNm_PassiveStartUp shall initiate the Passive Startup of the FlexRay NM.

FRNM138: The function FrNm_PassiveStartUp shall trigger the transition from Bus-Sleep Mode to the Network Mode in Repeat Message State (via the Synchronize State).

FRNM260: The function FrNm_PassiveStartUp shall have no effect on the operation mode of the FlexRay NM module if the current state is not Bus-Sleep Mode. In that case the function FrNm_PassiveStartUp shall return NM_E_NOT_EXECUTED (see FRNM138).

8.3.3 FrNm_NetworkRequest

FRNM238:

Service name:	FrNm_NetworkReques	
Syntax:		Nm_NetworkRequest(kHandleType NetworkHandle
Service ID[hex]:	0x02	
Sync/Async:	Asynchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	NetworkHandle	Identification of the NM-channel
Parameters (inout):	None	
Parameters (out):	None	
Return value:	_ 51	NM_E_OK: No error NM_E_NOT_OK: Requesting of bus communication has failed
Description:	This function requests t Network state shall be o	he network because the ECU needs to communicate on the bus. changed to 'requested'.

FRNM261: The function FrNm_NetworkRequest shall be only available if the configuration parameter FRNM_PASSIVE_MODE_ENABLED is set to OFF.

8.3.4 FrNm_NetworkRelease

FRNM239:

Service name:	FrNm_NetworkRelease				
Syntax:	Nm_ReturnType FrNm_NetworkRelease(
	const NetworkHandleType NetworkHandle				
)				
Service ID[hex]:	0x03				
Sync/Async:	Asynchronous				
Reentrancy:	Non Reentrant				
Parameters (in):	NetworkHandle 1	Identification of the NM-channel			
Parameters	None				
(inout):					
Parameters (out):	None				
Return value:	Nm_ReturnType	NM_E_OK: No error			
Return value.	l	NM_E_NOT_OK: Releasing of bus communication has failed			
Description:	This function releases the	e network because the ECU doesn't have to communicate on the			
	bus. Network state shall	be changed to 'released'.			

FRNM262: The function FrNm_NetworkRelease shall be only available if the configuration parameter FRNM_PASSIVE_MODE_ENABLED is set to OFF.

8.3.5 FrNm_SetUserData

FRNM240:

Service name:	FrNm_SetUserData			
Syntax:	<pre>Nm_ReturnType FrNm_SetUserData(const NetworkHandleType NetworkHandle, const uint8* const nmUserDataPtr)</pre>			
Service ID[hex]:	0x06			
Sync/Async:	Synchronous			
Reentrancy:	Non Reentrant			
Parameters (in)	NetworkHandle	Identification of the NM-channel		
Parameters (in):	nmUserDataPtr	User data for the next transmitted NM message		
Parameters	None			

V3.4.0 R3.2 Rev 3

(inout):		
Parameters (out):	None	
Return value:		NM_E_OK: No error NM_E_NOT_OK: Setting of user data has failed
Description:	This function sets user data for NM-Data transmitted next on the bus.	

FRNM043: If user data handling is enabled for the FlexRay NM module, the function FrNm_SetUserData shall set the user data.

FRNM263: The function FrNm_SetUserData shall be only available if the configuration parameter **FrNmUserDataEnabled** is set to ON. (see <u>FRNM077</u>)

8.3.6 FrNm_GetUserData

FRNM241:

Service name:	FrNm_GetUserData	
Syntax:	<pre>Nm_ReturnType FrNm_GetUserData(</pre>	
Service ID[hex]:	0x07	
Sync/Async:	Synchronous	
Reentrancy:	Reentrant	
Parameters (in):	NetworkHandle Identification of the NM-channel	
Parameters (inout):	None	
Parameters (out):	nmUserDataPtr Pointer to the location where the user data from the last successfully received NM message shall be copied.	
Return value:	Nm_ReturnType NM_E_OK: No error NM_E_NOT_OK: Getting of user data has failed	
Description:	This function gets user data from the last successfully received NM message.	

FRNM044: If user data handling is enabled for the FlexRay NM module, the function FrNm_GetUserData shall provide the user data from the last received NM-Data PDU.

FRNM264: The function FrNm_GetUserData shall be only available if the configuration parameter **FrNmUserDataEnabled** is set to ON. (see <u>FRNM077</u>)

8.3.7 FrNm_GetPduData

FRNM242:

Service name:	FrNm_GetPduData	FrNm_GetPduData	
Syntax:	<pre>Nm_ReturnType FrNm_GetPduData(</pre>		
Service ID[hex]:	0x08		
Sync/Async:	Synchronous		
Reentrancy:	Reentrant		
Parameters (in):	NetworkHandle	Identification of the NM-channel	
Parameters (inout):	None		
Parameters (out):	nmPduData	Pointer where NM PDU shall be copied to.	
Return value:	Nm_ReturnType	NM_E_OK: No error NM_E_NOT_OK: Getting of NM PDU data has failed	
Description:	Gets PDU data.		

FRNM265: The function FrNm_GetPduData shall get the whole PDU data out of the most recently received NM message.

FRNM266: The function **FrNm_GetPduData** shall be only available if the configuration parameter **FrNmUserDataEnabled** is set to ON.

8.3.8 FrNm_RepeatMessageRequest

FRNM243:

Service name:	FrNm_RepeatMessageRequest
Syntax:	<pre>Nm_ReturnType FrNm_RepeatMessageRequest(</pre>
Service ID[hex]:	0x09
Sync/Async:	Asynchronous
Reentrancy:	Non Reentrant
Parameters (in):	NetworkHandle Identification of the NM-channel
Parameters (inout):	None
Parameters (out):	None
Return value:	Nm_ReturnType NM_E_OK: No error NM_E_NOT_OK: Repeat Message Request has failed NM_E_NOT_EXECUTED: Repeat Message Request has not been executed
Description:	This function causes a Repeat Message Request to be transmitted next on the bus.

FRNM172: If node detection is enabled, the function FrNm_RepeatMessageRequest shall request the node detection on the FlexRay Bus NM nodes.

FRNM226: If the FlexRay NM module's environment is calling the function **FrNm_RepeatMessageRequest** in Bus Sleep Mode or Synchronize no functionality shall be executed and NM_E_NOT_EXECTUED shall be returned.

FRNM228: The function FrNm_RepeatMessageRequest shall be only available if the configuration parameter FrNmNodeDetectionEnabled is set to ON. (see FRNM170)

8.3.9 FrNm_GetNodeldentifier

FRNM244:

Service name:	FrNm_GetNodeIdentifier
Syntax:	<pre>Nm_ReturnType FrNm_GetNodeIdentifier(const NetworkHandleType NetworkHandle, uint8* const nmNodeIdPtr)</pre>
Service ID[hex]:	0x0a
Sync/Async:	Synchronous
Reentrancy:	Reentrant
Parameters (in):	NetworkHandle Identification of the NM-channel
Parameters (inout):	None
Parameters (out):	nmNodeIdPtr Pointer to the location where the node identifier from the last successfully received NM-message shall be copied.
Return value:	Nm_ReturnType NM_E_OK: No error NM_E_NOT_OK: Getting of the node identifier out of the last received NM-message has failed
Description:	This function gets the node identifier from the last successfully received NM-message.

FRNM047: If node detection is enabled, the function FrNm_GetNodeIdentifier shall provide the node identifier out of the most recently received NM-message.

FRNM267: The function FrNm_GetNodeIdentifier shall be only available if the configuration parameter FrNmNodeDetectionEnabled is set to ON. (see <u>FRNM170</u>)

8.3.10 FrNm_GetLocalNodeldentifier

FRNM245:

Service name:	FrNm_GetLocalNodeIdentifier
Syntax:	<pre>Nm_ReturnType FrNm_GetLocalNodeIdentifier(const NetworkHandleType NetworkHandle, uint8* const nmNodeIdPtr)</pre>
Service ID[hex]:	0x0b
Sync/Async:	Synchronous
Reentrancy:	Reentrant
Parameters (in):	NetworkHandle Identification of the NM-channel
Parameters (inout):	None
Parameters (out):	nmNodeIdPtr Pointer the location where the node identifier of the local node shall be copied.
Return value:	Nm_ReturnType NM_E_OK: No error NM_E_NOT_OK: Getting of the node identifier of the local node has failed
Description:	This function gets the node identifier configured for the local node.

FRNM046: If node detection is enabled, the function FrNm_GetLocalNodeIdentifier shall provide the node identifier configured for the local host node (FrNmNodeId).

FRNM268: The function FrNm_GetLocalNodeldentifier shall be only available if the configuration parameter FrNmNodeDetectionEnabled is set to ON. (see <u>FRNM170</u>)

8.3.11 FrNm_RequestBusSynchronization

FRNM246:

Service name:	FrNm_RequestBusSynchronization	
Syntax:	<pre>Nm_ReturnType FrNm_RequestBusSynchronization(</pre>	
Service ID[hex]:	0xc0	
Sync/Async:	Asynchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	NetworkHandle	Identification of the NM-Cluster
Parameters (inout):	None	
Parameters (out):	None	
Return value:	Nm_ReturnType	NM_E_OK: No error NM_E_NOT_OK: Function failed
Description:	This function has no functionality - the service is provided only to be compatible to future extensions and to be compatible to the CAN-NM interface.	

FRNM174: The FlexRay NM module shall support the function

FrNm_RequestBusSynchronization by returning NM_E_OK without executing any functionality.

Rationale: As the FlexRay Bus is a synchronous bus, the FlexRay NM cannot influence the bus synchronization. This functionality is handled by the FlexRay Controller and FlexRay Driver. Since this function is used by future extensions (e.g. Gateway) the function shall at least be available.

FRNM269: The function FrNm_RequestBusSynchronization shall be only available if the configuration parameter FrNmBusSynchronizationEnabled is set to ON.

8.3.12 FrNm_CheckRemoteSleepIndication

FRNM247:

Service name:	FrNm_CheckRemoteSleepIndication	
Syntax:	<pre>Nm_ReturnType FrNm_CheckRemoteSleepIndication(const NetworkHandleType NetworkHandle, boolean* const nmRemoteSleepIndPtr)</pre>	
Service ID[hex]:	0x0d	
Sync/Async:	Synchronous	
Reentrancy:	Reentrant (but not for the same NM-Channel)	
Parameters (in):	NetworkHandle Identification of the NM-channel	
Parameters (inout):	None	
Parameters (out):	nmRemoteSleepIndPtr Pointer to the location where the check result of remote sleep indication shall be copied.	
Return value:	Nm_ReturnType NM_E_OK: No error NM_E_NOT_OK: Checking of remote sleep indication bits has failed NM_E_NOT_EXECUTED: Checking of remote sleep indication has not executed	
Description:	This function checks if remote sleep indication has taken place or not.	

- **FRNM270:** The FlexRay NM module and the NmIf module shall be initialized correctly before the FlexRay NM module's environment is calling the function FrNm_CheckRemoteSleepIndication.
- **FRNM185**: The FlexRay NM function **FrNm_CheckRemoteSleepIndication** shall provide the information about current status of Remote Sleep Indication (i.e. already detected or not).
- **FRNM271:** The function FrNm_CheckRemoteSleepIndication shall be only available if the configuration parameter FrNmRemoteSleepIndicationEnabled is set to ON.

8.3.13 FrNm_GetState

FRNM248:

Service name:	FrNm_GetState	
Syntax:	Nm_ReturnType FrNm_GetState(const NetworkHandleType NetworkHandle, Nm_StateType* const nmStatePtr, Nm_ModeType* const nmModePtr)	
Service ID[hex]:	0x0e	
Sync/Async:	Synchronous	
Reentrancy:	Reentrant	
Parameters (in):	NetworkHandle Identification of the NM-channel	
Parameters (inout):	None	
Parameters (out):		Pointer to the location where the state of the network management shall be copied.
		Pointer to the location where the mode of the network management shall be copied.
Return value:		NM_E_OK: No error NM_E_NOT_OK: Getting of NM state has failed
Description:	This function retu	irns the state and the mode of the network management.

FRNM104: The function **FrNm_GetState** shall provide consistent information about the current state and the current mode of the NM state machine.

Note: Consistency between the provided values and the current values of the state and mode shall be guaranteed.

8.3.14 FrNm_GetVersionInfo

FRNM249:

Service name:	FrNm_GetVersionInfo	
Syntax:	<pre>void FrNm_GetVersionInfo(Std VersionInfoType* NmVerInfoPtr</pre>	
) – 11	
Service ID[hex]:	0x0f	
Sync/Async:	Synchronous	
Reentrancy:	Reentrant	
Parameters (in):	None	
	None	
(inout):		
Parameters (out):	NmVerInfoPtr Pointer to the location where the version information of this module shall be copied.	
Return value:	None	
	Returns the version information.	

FRNM272: The function FrNm_GetVersionInfo shall return the version information of this module. The version information includes:

- Module Id
- Vendor Id
- Vendor specific version numbers (BSW00407).

FRNM273: If source code for caller and callee of FrNm_GetVersionInfo is available, the FlexRay NM module should realize FrNm_GetVersionInfo as a macro, defined in the module's header file.

FRNM274: The function FrNm_GetVersionInfo shall be only available if the configuration parameter FrNmVersionInfoApi is set to ON.

8.3.15 FrNm_StartupError

FRNM393

Service name:	FrNm_StartupError	
Syntax:	void FrNm_StartupError(const NetworkHandleType NetworkHandle	
)	
Service ID[hex]:	0x10	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	NetworkHandle Identification of the NM-channel	
Parameters	None	
(inout):		
Parameters (out):	None	
Return value:	None	
Description:	This function is called by the FrSM when synchronization of the FlexRay cluster could not be achieved.	

8.3.16 FrNm_Transmit

FRNM401

Service name:	FrNm_Transmit	
Syntax:	- PduIdTy	ype FrNm_Transmit(pe FrNmTxPduId, duInfoType* PduInfoPtr
Service ID[hex]:	0x11	
Sync/Async:	Synchronous	
Reentrancy:	Reentrant	
Parameters (in):	FrNmTxPduId PduInfoPtr	L-PDU handle of FlexRay L-PDU to be transmitted. This handle specifies the corresponding FlexRay LPDU ID and implicitly the FlexRay Driver instance as well as the corresponding FlexRay controller device. Pointer to a structure with FlexRay L-PDU related data: DLC and pointer to FlexRay L-SDU buffer.
Parameters (inout):	None	
Parameters (out):	None	
Return value:		E_OK Transmit request has been accepted E_NOT_OK Transmit request has not been accepted (FrNm is not in RM or NO)
Description:	This is only a du PDUs identical t	ammy function to avoid linker errors and handle the spontaneous NM to CanNm.

Note: The FlexRay NM shall realize a Transmit function only if the node is configured as an active node, i.e., only if FRNM_PASSIVE_MODE_ENABLED (configuration parameter) is set as OFF

8.3.17 FrNm_SetCoordBits

FRNM403

Service name:	FrNm_SetCoordBits
Syntax:	<pre>Nm_ReturnType FrNm_SetCoordBits(const NetworkHandleType nmChannelHandle, const uint8 nmCoordBits)</pre>
Service ID[hex]:	0x12
Sync/Async:	Synchronous
Reentrancy:	Non Reentrant
Parameters (in):	nmChannelHandle Identification of the NM-channel
Parameters (III):	nmCoordBits Priority of the NM coordinator
Parameters (inout):	None
Parameters (out):	None
Return value:	Nm_ReturnType
Description:	Set the two bits in the Control Bit Vector which represent the NM coordinator ID.

8.3.18 FrNm_SetSleepReadyBit

Specification of FlexRay Network Management V3.4.0

R3.2 Rev 3

Service name:	FrNm_SetSleepReadyBit
Syntax:	<pre>Nm_ReturnType FrNm_SetSleepReadyBit(</pre>
Service ID[hex]:	0x13
Sync/Async:	Synchronous
Reentrancy:	Non Reentrant
Parameters (in):	nmChannelHandle Identification of the NM-channel
Parameters (m).	nmSleepReadyBit Value written to ReadySleep Bit in CBV
Parameters	None
(inout):	
Parameters (out):	None
Return value:	Nm_ReturnType NM_E_OK: No error NM_E_NOT_OK: Writing of remote sleep indication bit has failed
Description:	Set the NM Coordinator Sleep Ready bit in the Control Bit Vector

8.4 Call-back notifications: NM callbacks provided to lower layers

8.4.1 FrNm_RxIndication

FRNM251:

Service name:	FrNm_RxIndication	
Syntax:	<pre>void FrNm_RxIndication(PduIdType FrNmRxPduId, const PduInfoType* PduInfoPtr)</pre>	
Service ID[hex]:	0xe1	
Sync/Async:	Synchronous	
Reentrancy:	Reentrant	
	FrNmRxPduIdID of FlexRay NM PDU that has been received	
Parameters (in):	PduInfoPtr Contains the length (SduLength) of the received I-PDU and a pointer to a buffer (SduDataPtr) containing the I-PDU.	
Parameters (inout):	None	
Parameters (out):	None	
Return value:	None	
Description:	This function is called by the FlexRay Interface after a FlexRay NM PDU has been received.	

FRNM013: The function FrNm_RxIndication shall handle the data from the NM-message that means the function shall copy the received FlexRay NM PDU and store it locally with respect to the received FlexRay NM PDU ID.

FRNM276: The FrIf module and the FrNm module shall be initialized correctly before the FlexRay NM module's environment is calling the function FrNm_RxIndication.

The function FrNm_RxIndication might be called by the FlexRay NM module's environment in an interrupt context.

8.4.2 FrNm_TriggerTransmit

FRNM252:

Service name:	FrNm_TriggerT	ransmit
Syntax:	- PduIdTy	ype FrNm_TriggerTransmit(pe FrNmTxPduId, Type* PduInfoPtr
Service ID[hex]:	0xe4	
Sync/Async:	Synchronous	
Reentrancy:	Reentrant	
Parameters (in):	FrNmTxPduId	ID of FlexRay NM PDU that has been triggered
Parameters (inout):	PduInfoPtr	Contains a pointer to a buffer (SduDataPtr) to where the SDU shall be copied to. On return, the service will indicate the length of the copied SDU data in SduLength.
Parameters (out):	None	
Return value:		E_OK: SDU has been copied and SduLength indicates the number of copied bytes. E_NOT_OK: No SDU has been copied. PduInfoPtr must not be used since it may contain a NULL pointer or point to invalid data.
Description:	This function is transmitted.	called by the FlexRay Interface when FlexRay NM PDU has to be

FRNM280: The function FrNm_TriggerTransmit shall copy the triggered FlexRay NM PDU with respect to the triggered FlexRay NM PDU ID.

FRNM277: The Frlf module and the FrNm module shall be initialized correctly before the FlexRay NM module's environment is calling the function FrNm_TriggerTransmit.

The function FrNm_TriggerTransmit might be called by the FlexRay NM module's environment in an interrupt context.

8.4.3 FrNm_ TxConfirmation

Service name:	FrNm_TxConfirmation
Syntax:	<pre>void FrNm_TxConfirmation(</pre>
	PduIdType FrNmTxPduId
)
Service ID[hex]:	0xe0
Sync/Async:	Synchronous
Reentrancy:	Reentrant
Parameters (in):	FrNmTxPduId ID of FlexRay NM PDU that has been transmitted
Parameters	None
(inout):	
Parameters (out):	None
Return value:	None
Description:	This function is called by the FlexRay Interface after a FlexRay NM PDU has been transmitted.

Caveats: This API service is called during the execution of the FrNm_MainFunction_<NmClstIdx>

R3.2 Rev 3

8.5 Scheduled functions: FrNm Services provided to BSW Scheduler

8.5.1 FrNm_MainFunction_<NmClstldx>

FRNM255:

Service name:	FrNm_MainFunction_ <nmclstidx></nmclstidx>
Syntax:	void FrNm_MainFunction_ <nmclstidx>(</nmclstidx>
)
Service ID[hex]:	0xf0
Timing:	FIXED_CYCLIC
Description:	Main function of FlexRay NM.

This cyclically executed API service of the FlexRay Network Management serves the purposes of maintenance of the FrNm State Machine (see 7.4). Please refer to chapter 7.2

This API service of the FlexRay Network Management is cyclically called from a task body provided by the BSW Scheduler.

Since the duration of a FlexRay Cycle may be different for two Clusters of an ECU, the calling period of this API service shall be configurable independently for each Cluster at system configuration time.

FRNM283: There shall be one dedicated FlexRay NM Main Function for each NM cluster. The API names are therefore:

- FrNm_MainFunction_0() for FlexRay NM cluster associated with FlexRay NM cluster 0
- FrNm_MainFunction_1() for FlexRay NM cluster associated with FlexRay NM cluster 1
- Etc.

[FRNM452]It shall be possible to perform an independent processing of transmission- and reception-handling inside the main function according to BSW00432 [4].

Note: The maximum number of independent FrNm Clusters is defined by the FrNm global definition FrNmNumberOfClusters (see chapter FrNmGlobalConstants).

8.6 Expected interfaces: Services called by the FrNm

8.6.1 Mandatory Interfaces to FrIf, Dem and FrSm

This chapter presents interfaces required to fulfill mandatory NM functionality.

FRNM256:

API function	Description
Dem_ReportErrorStatus	Reports errors to the DEM.
FrIf_GetGlobalTime	Wraps the FlexRay Driver API function Fr_GetGlobalTime().
FrIf_GetNmVector	Derives the FlexRay NM Vector.
FrIf_Init	Initializes the FlexRay Interface.
FrIf_Transmit	Requests the sending of a PDU.
Nm_BusSleepMode	Notification that the network management has entered Bus-Sleep Mode.
Nm_NetworkMode	Notification that the network management has entered Network Mode. The callback function shall enable transmission of application messages.
Nm_NetworkStartIndication	Notification that a NM-message has been received in the Bus-Sleep Mode, what indicates that some nodes in the network have already entered the Network Mode. The callback function shall start the network management state machine.
Nm_PduRxIndication	Notification that a NM message has been received.

Note: The Generic NM Interface is currently seen as thin adaptation layer (e.g. implemented as c-macros) which will be used to interface to the ComM. See [6].

8.6.2 NM_NetworkStartIndication

FRNM304:

Service name:	< Nm_NetworkStartIndication >
Syntax:	<pre>void < Nm_NetworkStartIndication >(</pre>
Service ID[hex]:	0x00
Sync/Async:	Synchronous
Reentrancy:	Reentrant for different FrNm Clusters. Non reentrant for the same FrNm Cluster
Parameters (in):	nmNetworkHandle Identification of the NM-Cluster
Parameters (inout):	None
Parameters (out):	None
Return value:	None
	This API service of an upper layer Nm is called by the FlexRay Network Management to indicate to this upper layer BSW module that a NM-message was successfully received and the FrNm is in the Bus-Sleep Mode.

Caveats: This API service is called during the execution of the FlexRay Network Management module (e.g. by the FrNm_MainFunction_<NmClstldx>).

8.6.3 NM_PduRxIndication

FRNM305:

_	
Service name:	< Nm_PduRxIndication >
Syntax:	void < Nm PduRxIndication >(
	const NetworkHandleType nmNetworkHandle
Service ID[hex]:	0x00
Sync/Async:	Synchronous
Reentrancy:	Reentrant for different FrNm Clusters. Non reentrant for the same FrNm Cluster
Parameters (in):	nmNetworkHandle Identification of the NM-Cluster
Parameters	None
(inout):	
Parameters (out):	None
Return value:	None
Description:	This API service of an upper NM is called by the FlexRay Network Management to
•	indicate to this upper layer BSW module Nm that a NM-message was successfully
	received (see FRNM190)
	, , , , , , , , , , , , , , , , , , ,
	This function is only available on the definition of _PDU_RX_INDICATION_ENABLED

Caveats: This API service is called during the execution of the FlexRay Network Management module (e.g. by the FrNm_MainFunction_<NmClstldx>).

8.6.4 Optional Interfaces

This chapter presents interfaces required to fulfil optional NM functionality.

FRNM257:

API function	Description
Det_ReportError	Service to report development errors.
Nm_ActiveCoordIndication	Set the two bits in the Control Bit Vector which represent the NM coordinator ID.
Nm_CarWakeUpIndication	This function is called by a <bus>Nm to indicate reception of a CWU request.</bus>
Nm_CoordReadyToSleepCancellation	Cancels an indication, when the NM Coordinator Sleep Ready bit in the Control Bit Vector is set back to 0.
Nm_CoordReadyToSleepIndication	Sets an indication, when the NM Coordinator Sleep Ready bit in the Control Bit Vector is set
Nm_RemoteSleepCancellation	Notification that the network management has detected that not all other nodes on the network are any longer ready to enter Bus-Sleep Mode.
Nm_StateChangeNotification	Notification that the state of the lower layer <busnm> has changed.</busnm>
Nm_TxTimeoutException	Service to indicate that an attempt to send an NM message failed.

8.7 Configurable Interfaces

This chapter lists all interfaces where the target API service of any upper layer to be called has to be set up by static configuration of the FlexRay Network Management. These call-out services are specified and implemented in the upper layer BSW modules, which use the FlexRay Network Management according to [1]. The specific call-out notification is specified in the corresponding AUTOSAR SWS document (see chapter 0).

In addition to upper layer AUTOSAR BSW modules, the FrNm shall, with the functionality described within the specification in hand, also support other non-AUTOSAR upper layer software modules, provided that these modules interact with the FrNm in the same manner as the upper layer AUTOSAR BSW modules. In particular, those non-AUTOSAR modules need to provide APIs as described in this chapter.

8.7.1 _RemoteSleepCancellation

FRNM299:

Service name:	< UL_RemoteSleepCancellation >
Syntax:	<pre>void < UL_RemoteSleepCancellation >(</pre>
	const NetworkHandleType nmNetworkHandle
)
Service ID[hex]:	0x00
Sync/Async:	Synchronous
Reentrancy:	Reentrant for different FrNm Clusters. Non reentrant for the same FrNm Cluster
Parameters (in):	nmNetworkHandle Identification of the NM-Cluster
Parameters	None
(inout):	
Parameters (out):	None
Return value:	None
Description:	This API service of an upper layer BSW module (e.g. ComM) is called by the
	FlexRay Network Management to indicate to this upper layer BSW module that the
	"Remote Sleep" has been cancelled as an NM-message with an indication to keep the bus
	awake has been received and the Remote Sleep indication has been previously detected.

Caveats: This API service is called during the execution of the FlexRay Network Management module (e.g. by the **FrNm_MainFunction_<NmClstldx>**).

8.7.2 _RemoteSleepIndication

FRNM300:

Service name:	< UL_RemoteSleepIndication >				
Syntax:	<pre>void < UL_RemoteSleepIndication >(const NetworkHandleType nmNetworkHandle</pre>				
Service ID[hex]:	0x00				
Sync/Async:	Synchronous				
Reentrancy:	Reentrant for different FrNm Clusters. Non reentrant for the same FrNm Cluster				
Parameters (in):	nmNetworkHandle Identification of the NM-Cluster				
Parameters	None				
(inout):					
Parameters (out):	None				
Return value:	None				
	This API service of an upper layer BSW module (e.g. ComM) is called by the FlexRay Network Management to indicate to this upper layer BSW module that all other nodes in the cluster are ready to sleep (the 'Remote Sleep Indication'), as no NM-messages with an indication to keep the bus awake are received in the Normal Operation State for a configurable amount of time determined by the FRNM_REMOTE_SLEEP_IND_TIME (configuration parameter).				

Caveats: This API service is called during the execution of the FlexRay Network Management module (e.g. by the FrNm_MainFunction_<NmClstldx>).

8.7.3 **_TransmissionTimeoutException**

FRNM302:

- ·	Y					
Service name:	< UL_TransmissionTimeoutException >					
Syntax:	<pre>void < UL TransmissionTimeoutException >(</pre>					
	const NetworkHandleType nmNetworkHandle					
Service ID[hex]:	0x00					
Sync/Async:	Synchronous					
Reentrancy:	Reentrant for different FrNm Clusters. Non reentrant for the same FrNm Cluster					
Parameters (in):	nmNetworkHandle Identification of the NM-Cluster					
Parameters	None					
(inout):						
Parameters (out):	None					
Return value:	None					
Description:	This API service of an upper layer BSW module is called by the FlexRay Network					
	Management to indicate to this upper layer BSW module that no NM-message could					
	successfully be transmitted within the time interval of FRNM_MSG_TIMEOUT_TIME,					
	and the periodic NM-message transmission is running.					

Caveats: This API service is called during the execution of the FlexRay Network Management module (e.g. by the FrNm_MainFunction_<NmClstldx>).

Callback is available if FrNmMsgTimeoutTime >0

9 Sequence diagrams

9.1 Passive Startup

Sequence in Figure 9-1 shows the normal passive startup.

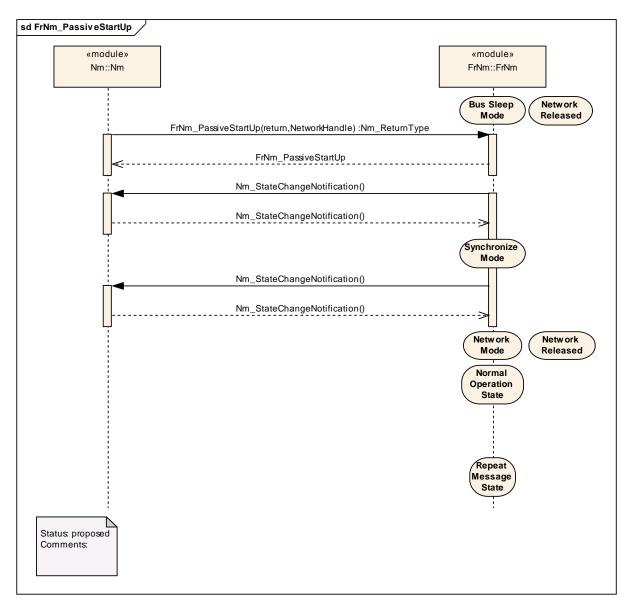

Figure 9-1 FrNm passive startup sequence

R3.2 Rev 3

9.2 Passive Startup with a Network Request

Sequence in Figure 9-2 shows a passive startup where a network is requested before Network Mode has been reached.

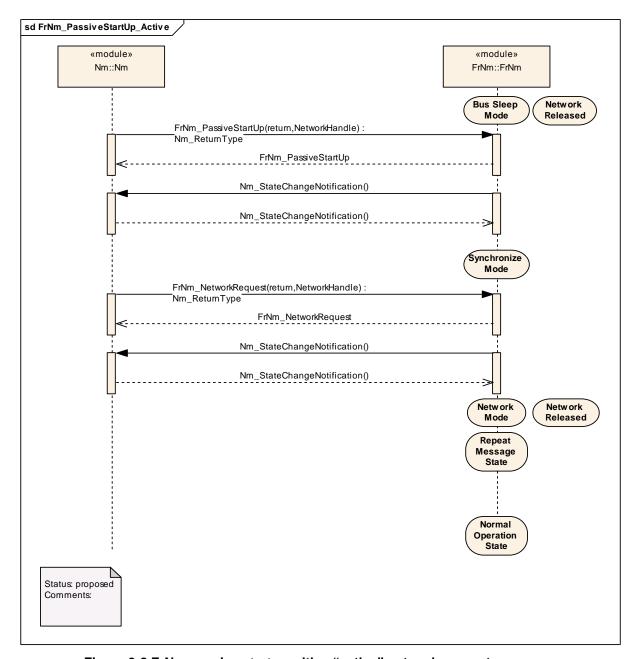

Figure 9-2 FrNm passive startup with a "active" network request sequence

9.3 Normal Operation

Sequence in Figure 9-3 shows how to request and release the network

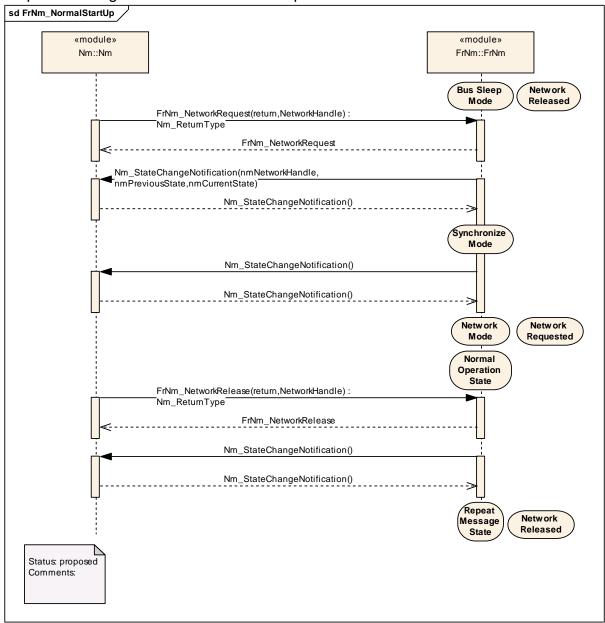

Figure 9-3 FrNm normal operation sequence

9.4 Shutdown

Sequence in Figure 9-4 shows a normal shutdown sequence.

10 Configuration specification

The following chapter contains tables of all configuration parameters and switches used to determine the functional units of the AUTOSAR Generic Network Management. The default values of configuration parameters are denoted as bold.

FRNM020: Both static and runtime configuration parameters shall be located outside the source code of the module.

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification Chapter 10.1 describes fundamentals. It also specifies a template (table) for the parameter specification. Chapter 10.2 specifies the structure (containers) and the parameters of the module FrNm. Chapter 10.3 specifies published information of the module FrNm.

10.1 How to read this chapter

In addition to this section, it is highly recommended to read the documents:

- AUTOSAR Layered Software Architecture [1]
- AUTOSAR ECU Configuration Specification
 This document describes the AUTOSAR configuration methodology and the AUTOSAR configuration metamodel in detail.

The following is only a short survey of the topic and it will not replace the ECU Configuration Specification document.

10.1.1 Configuration and configuration parameters

Configuration parameters define the variability of the generic part(s) of an implementation of a module. This means that only generic or configurable module implementation can be adapted to the environment (software/hardware) in use during system and/or ECU configuration.

The configuration of parameters can be achieved at different times during the software process: before compile time, before link time or after build time. In the following, the term "configuration class" (of a parameter) shall be used in order to refer to a specific configuration point in time.

10.1.2 Variants

Variants describe sets of configuration parameters. E.g., variant 1: only pre-compile time configuration parameters; variant 2: mix of pre-compile- and post build time-configuration parameters. In one variant a parameter can only be of one configuration class.

10.1.3 Containers

Containers structure the set of configuration parameters. This means:

- all configuration parameters are kept in containers.
- (sub-) containers can reference (sub-) containers. It is possible to assign a multiplicity to these references. The multiplicity then defines the possible number of instances of the contained parameters.

10.1.4 Specification template for configuration parameters

The following tables consist of three sections:

- the general section
- the configuration parameter section
- the section of included/referenced containers

Pre-compile time

 specifies whether the configuration parameter shall be of configuration class *Pre-compile time* or not

Label	Description
Х	The configuration parameter shall be of configuration class <i>Pre-compile time</i> .
	The configuration parameter shall never be of configuration class <i>Pre-compile time</i> .

Link time

 specifies whether the configuration parameter shall be of configuration class *Link time* or not

Label	Description
Х	The configuration parameter shall be of configuration class Link time.
	The configuration parameter shall never be of configuration class <i>Link time</i> .

Post Build

 specifies whether the configuration parameter shall be of configuration class Post Build or not

Label	Description
х	The configuration parameter shall be of configuration class <i>Post Build</i> and no specific implementation is required.
L	Loadable - the configuration parameter shall be of configuration class Post Build and only one configuration parameter set resides in the ECU.
М	Multiple - the configuration parameter shall be of configuration class Post Build and is selected out of a set of multiple parameters by passing a dedicated pointer to the init function of the module.
	The configuration parameter shall never be of configuration class Post Build.

10.2 Variants

10.2.1 Variant 1: Pre-compile time

FRNM290: All configuration parameters are configurable at pre-compile time.

Use case: Source code optimizations

10.2.2 Variant 2: Pre-compile time of FrNmGlobalConfig

FRNM291: All configuration parameters of the container **FrNmGlobalConfig** related to enable or disable an optional feature shall be configurable at pre-compile time. The remaining configuration parameters shall be configurable at link time.

Use case: Object code libraries

10.2.3 Variant 3: Pre-compile time of FrNmGlobalConfig; PDU configure on post build

FRNM292: The parameters contained in **FrNm_PduConfig** are <u>configurable</u> at post-build time. The parameters contained in **FrNmGlobalConfig** are configurable at precompile time

Use case: ECU configuration can be flashed (L)

10.3 Configurable parameters

10.3.1 FrNm

Module Name	FrNm
Module Description	The Flexray Nm module

Included Containers			
Container Name	Multiplicity	Scope / Dependency	
FrNmChannelConfig		This container contains all configuration parameters of FlexRay NM configured from the channel perspective.	
FrNmGlobalConfig 1		This container contains all global configuration parameters for the FrNm module.	

10.4 Global configurable parameters

FRNM017: The Global Scope specifies configuration parameters that shall be defined in the module's configuration header file **FrNm_Cfg.h**.

10.4.1 FrNmGlobalConfig

SWS Item	:			
Container Name	FrNmGlobalConfig{FrNm_GlobalConfig}			
Description	This container contains all global configuration parameters for the FrNm module.			
Configuration Parameters				

Included Containers			
Container Name	Multiplicity	Scope / Dependency	
FrNmGlobalConstants		This container contains module constants related to the Flexray NM functionality.	
FrNmGlobalFeatures	1 1	This container contains module features related to the FlexRay NM functionality.	
FrNmGlobalProperties		This container contains module properties related to the FlexRay NM functionality.	

10.4.2 FrNmGlobalConstants

SWS Item	:		
Container Name	FrNmGlobalConstants{FrNm_GlobalConstants}		
II)escription	This container contains module constants related to the Flexray NM functionality.		
Configuration Parameters			

SWS Item	•
Name	FrNmNumberOfClusters {FRNM_NUMBER_OF_CLUSTERS}

Description	Number of AUTOSAR FR NM clusters allowed within one ECU.		
Multiplicity	1		
Туре	IntegerParamDef		
Range	1 255		
Default value

10.5 Channel configurable parameters

FRNM018: The Channel Scope (FrNm_ChannelConfig) specifies configuration parameters that shall be located in a data structure of type **FrNm_ConfigType**.

FRNM036: The following runtime configurable parameters shall be configurable for each channel separately.

10.5.1 FrNm

Module Name	FrNm
Module Description	The Flexray Nm module

Included Containers			
Container Name Multiplicity Scope / Dependency		Scope / Dependency	
FrNmChannelConfig		This container contains all configuration parameters of FlexRay NM configured from the channel perspective.	
FrNmGlobalConfig		This container contains all global configuration parameters for the FrNm module.	

10.5.2 FrNmChannelConfig

SWS Item	:
Container Name	FrNmChannelConfig{FrNm_ChannelConfigType} [Multi Config
Container Name	Container]
Description	This container contains all configuration parameters of FlexRay NM
Description	configured from the channel perspective.
Configuration Parameters	

Included Containers			
Container Name	Multiplicity	Scope / Dependency	
FrNmChannelIdentifiers		This container contains instance specific identifiers related to the respective FlexRay Channel.	
FrNmChannelTiming		This container contains instance-specific timing related to the respective FlexRay Channel.	

10.5.3 FrNmChannelldentifiers

SWS Item	:	
Container Name	FrNmChannelIdentifiers{Channel Identifiers}	
Description	This container contains instance specific identifiers related to the respective FlexRay Channel.	
Configuration Parameters		

SWS Item	:
Name	FrNmActiveWakeupBitEnabled
	{FRNM_ACTIVE_WAKEUP_BIT_ENABLED}

Description	Enables/Disables the handling of the Active Wakeup Bit in the FrNm				
	module.				
Multiplicity	01	01			
Туре	BooleanParamI	Def			
Default value	false	false			
ConfigurationClass	Pre-compile time	X	VARIANT-PRE-COMPILE		
	Link time X VARIANT-LINK-TIME, VARIANT-POST-BUILD				
	Post-build time				
Scope / Dependency	scope: local				
	dependency: This parameter is only valid if				
	FrNmPassiveModeEnabled is False.				

	ı		
SWS Item	:		
Name	FrNmCarWakeUpBitPosition		
	{FRNM_CAR_WAKE_U	JP_BIT_POSITION	ON}
Description	Specifies the Bit position	of the CWU with	in the NM-Message.
Multiplicity	1

10.6 Published parameters

Published information contains data defined by the implementer of the SW module that does not change when the module is adapted (i.e. configured) to the actual HW/SW environment. It thus contains version and manufacturer information.

FRNM019: The following table specifies configuration parameters that shall be published in the module's description file.

SWS Item	FRNM019		
Information elements			
Information element name	Type / Range	Information element description	
FRNM_VENDOR_ID	#define, uint16 /	Vendor ID of the dedicated implementation of this module according to the AUTOSAR vendor list	
FRNM_MODULE_ID	#define, uint16 /	Module ID of this module from Module List	
FRNM_AR_MAJOR_VERSION	#define, uint16 /	Major version number of AUTOSAR specification on which the appropriate implementation is based on.	
FRNM_AR_MINOR_VERSIC	#define, uint16 /	Minor version number of AUTOSAR specification on which the appropriate implementation is based on.	
FRNM_AR_PATCH_VERSION	#define, uint16 /	Patch level version number of AUTOSAR specification on which the appropriate implementation is based on.	
FRNM_SW_MAJOR_VERSION	#define, uint16 /	Major version number of the vendor specific implementation of the module. The numbering is vendor specific.	
FRNM_SW_MINOR_VERSION	#define, uint16 /	Minor version number of the vendor specific implementation of the module. The numbering is vendor specific.	
FRNM_SW_PATCH_VERSION	#define, uint16 /	Patch level version number of the vendor specific implementation of the module. The numbering is vendor specific.	

10.7 Configuration constraints

FRNM069: The following configuration constraints are conditionally recommended for FlexRay NM:

- NM_REPEAT_MESSAGE_TIME = 0 (conditions: (1) startup of all applications is completed as soon as the FlexRay communication is started and (2) node detection is not required in the FlexRay NM-cluster)
- FrNmReadySleepCnt = 0 (condition: bus communication is always shutting down at the end of the NM Repetition Cycle in all nodes within the same FlexRay NM-cluster, even in presence of race conditions)

R3.2 Rev 3

10.8 Examples

The following examples require FlexRay knowledge that is not described in the examples (e.g. the definition of a minislot). The FlexRay Communications System Specifications, V2.1 ([4]) contain the necessary information.

10.8.1 Example of Bus-Schedule with NM-Vote PDUs

Assume an example network of five nodes with the respective IDs of 1, 2, 3, 4 and 5 as shown in Figure 10-1 (unterhalb).

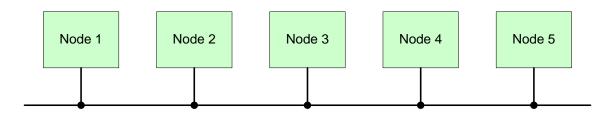

Figure 10-1 Example of five Node Network

The FlexRay Schedule allots 5 slots in the static segment and 6 slots in the dynamic segment as shown in Figure 10-2 (unterhalb). To keep the example simple the nodes are assigned static numerically equivalent to the node numbers, e.g., Node 1 is sending in static Slot 1, Node2 is sending in static slot 2 and so on.

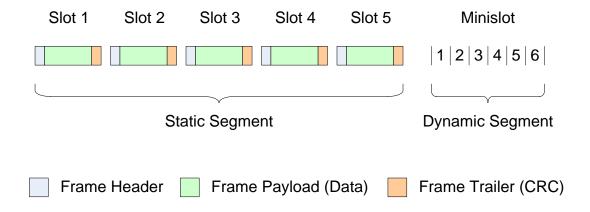

Figure 10-2 Example of Bus Schedule

Node 2 and 5 transmit their NM-Vote in the static segment, while the three remaining nodes 1, 3 and 4 transmit their NM-Vote in the dynamic segment as shown in Figure 10-3 (Seite 118).

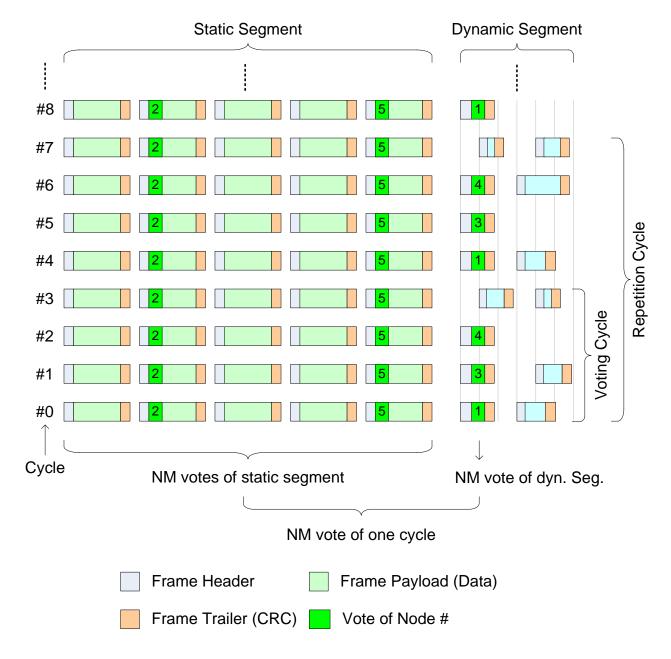

Figure 10-3 Example of NM-Vote in dynamic and static segment

As three dynamic voters exist, the Voting Cycle will be 4 and is repeated, therefore, every four cycles (cycle 0-1-2-3 and 4-5-6-7 and so on). Notice that no NM-Vote will be transmitted in last cycle of the Voting Cycle as all nodes have already voted. In this example the Repetition Cycle is set to 2, which is twice the Voting cycle. Therefore every node will sent his vote twice.

10.8.2 Example of Bus Schedule with NM-Data PDUs

This example uses the same setup as in the previous example (10.8.1) - five nodes (Figure 10-1 Seite 117), 5 slot in the static segment and 6 slots in the dynamic segment (Figure 10-2 Seite 117).

Five Node need to send their NM-Data, which leads to a Data Cycle of "8", as only 1,2,4,8,16,32 and 64 are allowed due the restriction of the FlexRay Cycle multiplexing (see <u>FRNM195</u>).

Figure 10-4 (unten) shows that Node 1 will send its NM-Data in cycle 2, 10 and so on. Node 2, 3, 4 and 5 will behave in a similar way.

As the Data Cycle is "8", all nodes will send their NM-Data only every 8 cycles.

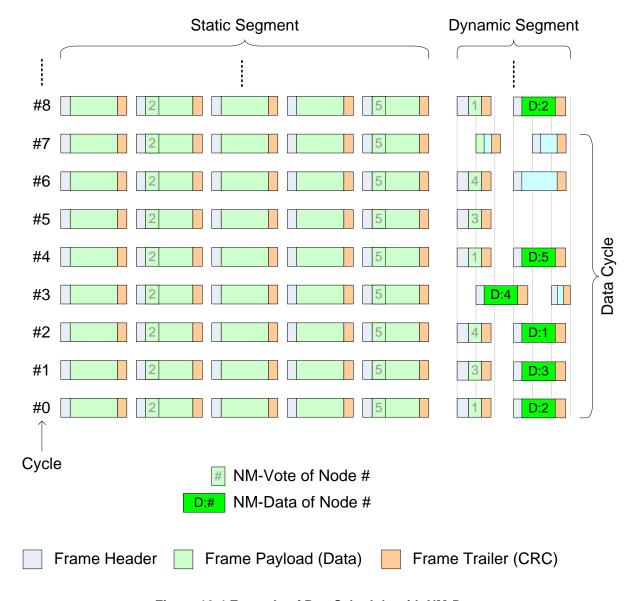

Figure 10-4 Example of Bus Schedule with NM-Data
