Advice for users

AUTOSAR Specification Documents may contain exemplary items (exemplary reference models, "use cases", and/or references to exemplary technical solutions, devices, processes or software).

Any such exemplary items are contained in the Specification Documents for illustration purposes only, and they themselves are not part of the AUTOSAR Standard. Neither their presence in such Specification Documents, nor any later documentation of AUTOSAR conformance of products actually implementing such exemplary items, imply that intellectual property rights covering such exemplary items are licensed under the same rules as applicable to the AUTOSAR Standard.

1 Introduction and functional overview

This specification describes the functionality, API and configuration of the Flash EEPROM Emulation Module (see Figure 1).

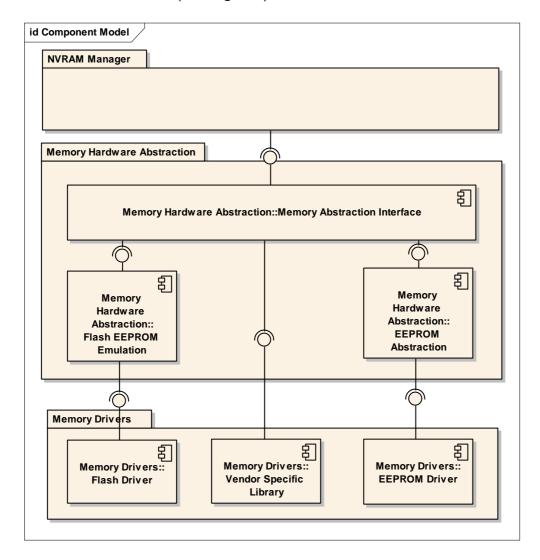

Figure 1: Module overview of memory hardware abstraction layer

The Flash EEPROM Emulation (FEE) shall abstract from the device specific addressing scheme and segmentation and provide the upper layers with a virtual addressing scheme and segmentation as well as a "virtually" unlimited number of erase cycles.

2 Acronyms and abbreviations

Acronyms and abbreviations which have a local scope and therefore are not contained in the AUTOSAR glossary must appear in a local glossary.

Abbreviation /	Description:
Acronym:	
EA	EEPROM Abstraction
EEPROM	Electrically Erasable and Programmable ROM (Read Only Memory)
FEE	Flash EEPROM Emulation
LSB	Least significant bit / byte (depending on context). Here, "bit" is meant.
MemIf	Memory Abstraction Interface
MSB	Most significant bit / byte (depending on context). Here, "bit" is meant.
N∨M	NVRAM Manager
NVRAM	Non-volatile RAM (Random Access Memory)
NVRAM block	Management unit as seen by the NVRAM Manager
(Logical) block	Smallest writable / erasable unit as seen by the modules user. Consists of one or
	more virtual pages.
Virtual page	May consist of one or several physical pages to ease handling of logical blocks and
	address calculation.
Internal residue	Unused space at the end of the last virtual page if the configured block size isn't an
	integer multiple of the virtual page size (see Figure 3)).
Virtual address	Consisting of 16 bit block number and 16 bit offset inside the logical block.
Physical	Address information in device specific format (depending on the underlying
address	EEPROM driver and device) that is used to access a logical block.
Dataset	Concept of the NVRAM manager: A user addressable array of blocks of the same
	size.
	E.g. could be used to provide different configuration settings for the CAN driver
	(CAN IDs, filter settings,) to an ECU which has otherwise identical application
	software (e.g. door module).
Redundant copy	Concept of the NVRAM manager: Storing the same information twice to enhance
	reliability of data storage.

4 Constraints and assumptions

4.1 Limitations

No limitations.

4.2 Applicability to car domains

No restrictions.

5 Dependencies to other modules

This module depends on the capabilities of the underlying flash driver as well as the configuration of the NVRAM manager.

5.1 File structure

5.1.1 Code file structure

[FEE059] [The code file structure shall not be defined within this specification.]()

5.1.2 Header file structure

[FEE002] [The file include structure shall be as follows:

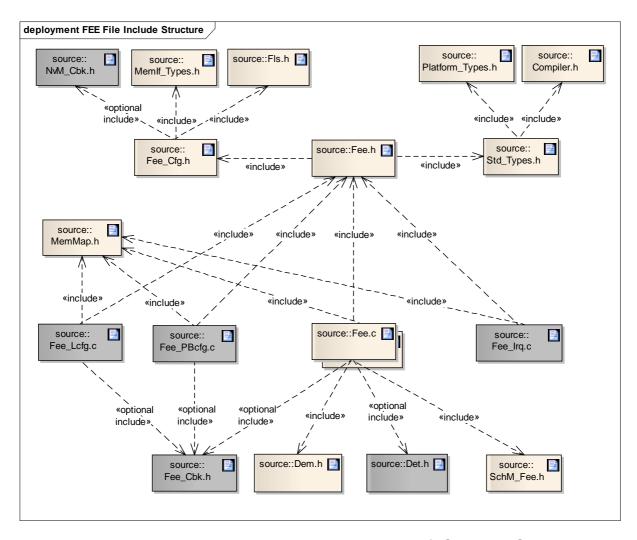

Figure 2: Flash EEPROM Emulation File Include Structure J(BSW167, BSW00383, BSW00346, BSW158, BSW00301)

Note: Files which are optional (depending on implementation / configuration) are shown in grey.

[FEE060] 「The module shall include the Dem.h file. By this inclusion, the APIs to report errors as well as the required Event Id symbols are included. This specification defines the name of the Event Id symbols which are provided by XML to the DEM configuration tool. The DEM configuration tool assigns ECU dependent values to the Event Id symbols and publishes the symbols in Dem_IntErrId.h. I()

Document: General Requirements on Basic Software Modules

Requirement	Satisfied by
[BSW00344] Reference to link-time configuration	Not applicable
	(this module does not provide any post-build
	parameters)
[BSW00404] Reference to post build time	Not applicable
configuration	(this module does not provide post build time
	configuration)
[BSW00405] Reference to multiple configuration	Not applicable
sets	(this module does not support multiple
	configuration sets)
[BSW00345] Pre-compile-time configuration	<u>FEE039</u> , <u>FEE040</u>
[BSW159] Tool-based configuration	<u>FEE039</u> , <u>FEE040</u>
[BSW167] Static configuration checking	<u>FEE041</u>
[BSW171] Configurability of optional functionality	Not applicable
	(no optional functionality)
[BSW170] Data for reconfiguration of AUTOSAR	Not applicable
SW-Components	(no reconfiguration supported)
[BSW00380] Separate C-File for configuration	Not applicable
parameters	(no link-time or post build time configuration
	parameters)
[BSW00381] Separate configuration header file	<u>FEE002</u>
for pre-compile time parameters	
[BSW00412] Separate H-File for configuration	Not applicable
parameters	(no link-time or post build time configuration
	parameters)
[BSW00383] List dependencies of configuration	<u>FEE002</u>
files	
[BSW00384] List dependencies to other modules	Chapter 5

[FD0]140000=100 // // // // // // // // // // // // /	101
[BSW00387] Specify the configuration class of	Chapter 08.5.1
callback function	
[BSW00388] Introduce containers	Chapter 10.1
[BSW00389] Containers shall have names	Chapter 10.1
[BSW00390] Parameter content shall be unique	Chapter 8, Chapter 10.2
within the module	
[BSW00391] Parameter shall have unique names	Chapter 8, Chapter 10.2
[BSW00392] Parameters shall have a type	Chapter 8, Chapter 10.2
[BSW00393] Parameters shall have a range	Chapter 8, Chapter 10.2
[BSW00394] Specify the scope of the parameters	Chapter 8, Chapter 10.2
[BSW00395] List the required parameters (per	Chapter 8, Chapter 10.2
parameter)	onapter of enapter role
[BSW00396] Configuration classes	Chapter 8, Chapter 10.2
[BSW00397] Pre-compile-time parameters	Chapter 8, Chapter 10.2
[BSW00398] Link-time parameters	Not applicable
[DSW00396] Link-time parameters	
[DCM00000] Landahla Daat haild tima a manasatana	(no link-time configuration parameters)
[BSW00399] Loadable Post-build time parameters	Not applicable
IDOMOG 4001 O. L. C. L. D. C. L. T. L.C.	(no post build time configuration parameters)
[BSW00400] Selectable Post-build time	Not applicable
parameters	(no post build time configuration parameters)
[BSW00402] Published information	Chapter 10.3
[BSW00375] Notification of wake-up reason	Not applicable
	(this module does not provide wakeup
	capabilities)
[BSW101] Initialization interface	FEE085
[BSW00416] Sequence of Initialization	Not applicable
	(requirement on system design, not a single
	module)
[BSW00406] Check module initialization	FEE120, FEE121, FEE122, FEE123, FEE124,
	FEE125, FEE126, FEE127, FEE010
[BSW168] Diagnostic Interface of SW	Not applicable
components	(this module does not provide special diagnostics
'	support)
[BSW00407] Function to read out published	Chapter8.3.9, FEE043_Conf
parameters	
[BSW00423] Usage of SW-C template to describe	Not applicable
BSW modules with AUTOSAR Interfaces	(this module does not provide an AUTOSAR
DOW Medalos Will 7 to 1 007 liv internaces	interface)
[BSW00424] BSW main processing function task	Not applicable
allocation	(requirement on system design, not on a single
anodation	module)
[BSW00425] Trigger conditions for schedulable	Not applicable
1	
objects	(requirement on the BSW module description
IDCM/004961 Evolucius areas in DOM/ resolution	template)
[BSW00426] Exclusive areas in BSW modules	Not applicable
[DOMO0407110D 1 1 1 1 2 2 1 1 1 1	(no exclusive areas defined in this module)
[BSW00427] ISR description for BSW modules	Not applicable
	(this module does not implement any ISRs)
[BSW00428] Execution order dependencies of	Not applicable
main processing functions	(only one main processing function in this module)
[BSW00429] Restricted BSW OS functionality	Not applicable
access	(this module does not use any OS functionality)
[BSW00431] The BSW Scheduler module	Not applicable
implements task bodies	(requirement on the BSW scheduler)
[BSW00432] Modules should have separate main	Not applicable
processing functions for read/receive and	(only one main processing function in this module)
write/transmit data path	, , , , , , , , , , , , , , , , , , , ,
[BSW00433] Calling of main processing functions	Not applicable
l state of the sta	(requirement on system design, not on a single
	, , , , , , , , , , , , , , , , , , ,

	module)
[BSW00434] The Schedule Module shall provide	Not applicable
an API for exclusive areas	(requirement on the schedule module - this is not it)
[BSW00336] Shutdown interface	Not applicable
	(this module does not provide shutdown
	capabilities)
[BSW00337] Classification of errors	FEE010
[BSW00338] Detection and Reporting of	FEE011
development errors	TEEOTT.
[BSW00369] Do not return development error	FEE045
codes via API	TELO43
	Not applicable
[BSW00339] Reporting of production relevant	Not applicable
error status	(no production relevant errors defined for this
[DOWO 404] December 1 and a the section of	module)
[BSW00421] Reporting of production relevant	Not applicable
error events	(no production relevant errors defined for this
	module)
[BSW00422] Debouncing of production relevant	Not applicable
error status	(requirement on the DEM, not this module)
[BSW00420] Production relevant error event rate	Not applicable
detection	(requirement on the DEM, not this module)
[BSW00417] Reporting of Error Events by Non-	Not applicable
Basic Software	(requirement on non BSW modules)
[BSW00323] API parameter checking	Not applicable
	(no parameter check specified for this module)
[BSW004] Version check	FEE013, FEE043_Conf
[BSW00409] Header files for production code	FEE047
error IDs	<u></u>
[BSW00385] List possible error notifications	Chapter 8.6
[BSW00386] Configuration for detecting an error	FEE010, FEE011, FEE045
[BSW161] Microcontroller abstraction	Not applicable
[DOW 101] Microcontroller abstraction	(requirement on AUTOSAR architecture, not a
	single module)
[BSW162] ECU layout abstraction	Not applicable
[DSW 102] ECO layout abstraction	
	(requirement on AUTOSAR architecture, not a
IDC/MO00041 Decretors LHC I/O Library	single module)
[BSW00324] Do not use HIS I/O Library	Not applicable
IDOMOGELNIA karaka da Ularia da Ularia	(architecture decision)
[BSW005] No hard coded horizontal interfaces	Not applicable
within MCAL	(requirement on AUTOSAR architecture, not a
	single module)
[BSW00415] User dependent include files	Not applicable
	(only one user for this module)
[BSW164] Implementation of interrupt service	Not applicable
routines	(this module does not implement any ISRs)
[BSW00325] Runtime of interrupt service routines	FEE069
[BSW00326] Transition from ISRs to OS tasks	Not applicable
	(requirement on implementation, not on
	specification)
[BSW00342] Usage of source code and object	Not applicable
code	(requirement on AUTOSAR architecture, not a
	single module)
[BSW00343] Specification and configuration of	FEE070
time	
[BSW160] Human-readable configuration data	Not applicable
	(requirement on documentation, not on
[BSW007] HIS MISRA C	specification) Not applicable
LIDSVVIII/ LIDS IVIISKA L.	I NOLADOUCADIE

[BSW00300] Module naming convention [BSW00413] Accessing instances of BSW	specification) Not applicable (requirement on implementation, not on specification) Requirement can not be implemented in R2.0
	(requirement on implementation, not on specification)
[BSW00413] Accessing instances of BSW	specification)
[BSW00413] Accessing instances of BSW	
[DOVVOU413] Accessing instances of BSVV	requirement can not be implemented in K2.0
	' ·
modules	timeframe.
[BSW00347] Naming separation of different instances of BSW drivers	Not applicable
instances of 65vv drivers	(requirement on the implementation, not on the
IDCM/0020E1 Calf defined data types naming	specification)
[BSW00305] Self-defined data types naming	Chapter 8.2
convention [BSW00307] Global variables naming convention	Net applicable
[b5vv00307] Global variables flaming convention	Not applicable (requirement on the implementation, not on the
	specification)
IDSW002101 ADI naming convention	Chapter 8.3
[BSW00310] API naming convention [BSW00373] Main processing function naming	Chapter 8.5.1
	Chapter 6.5.1
convention	FFF010
[BSW00327] Error values naming convention	FEE010
[BSW00335] Status values naming convention	Chapter 8.1
[BSW00350] Development error detection	FEE011, FEE062, FEE039
keyword	Chapter 10.1
[BSW00408] Configuration parameter naming	Chapter 10.1
convention	Objects 40.4
[BSW00410] Compiler switches shall have	Chapter 10.1
defined values	Objects 0.00
[BSW00411] Get version info keyword	Chapter 8.3.9
[BSW00346] Basic set of module files	FEE002
[BSW158] Separation of configuration from	<u>FEE002</u>
implementation	Nist and Parkita
[BSW00314] Separation of interrupt frames and	Not applicable
service routines	(this module does not implement any ISRs)
[BSW00370] Separation of callback interface from	Chapter 8.4
API	Niet aus Pastila
[BSW00348] Standard type header	Not applicable
[DCM00252] Distance and if a time has det	(requirement on the standard header file)
[BSW00353] Platform specific type header	Not applicable
IDCM000041 Committee on a iffer longuage	(requirement on the platform specific header file)
[BSW00361] Compiler specific language	Not applicable
extension header	(requirement on the compiler specific header file)
[BSW00301] Limit imported information	FEE002
[BSW00302] Limit exported information	Not applicable
	(requirement on the implementation, not on the
IDCM/00201 Avaid dealineties of each	specification)
[BSW00328] Avoid duplication of code	Not applicable
	(requirement on the implementation, not on the
IDCM/002421 Charact and a shall be accentical.	specification)
[BSW00312] Shared code shall be reentrant	Not applicable
	(requirement on the implementation, not on the
IDCM/00Cl Diotforms in dependence:	specification)
[BSW006] Platform independency	Not applicable (this is a module of the
	microcontroller abstraction layer)
[BSW00357] Standard API return type	Chapter 8.3.3, Chapter 8.3.4. Chapter 8.3.7,
	Chapter 8.3.10
[BSW00377] Module specific API return types	· ·
L = 1111 July 20 mm magai data typoo	
	specification)
[BSW00377] Module specific API return types [BSW00304] AUTOSAR integer data types	Chapter 8.3.6, Chapter 8.3.7 Not applicable (requirement on implementation, not for

documentation [BSW00334] Provision of XML file	(requirement on documentation, not on specification) Not applicable
	(requirement on documentation, not on
[BSW00341] Microcontroller compatibility	Not applicable
	specification)
numbers	(requirement on implementation, not for
[BSW00321] Enumeration of module version	Not applicable
[BSW00318] Format of module version numbers	FEE043_Conf
[BSW003] Version identification	FEE043_Conf
[BSW00379] Module identification	FEE043_Conf
[BSW00374] Module vendor identification	FEE043_Conf
	specification)
context	(requirement on documentation, not for
[BSW00333] Documentation of callback function	Not applicable
	specification)
i = 1.10.01	(requirement on documentation, not on
[BSW010] Memory resource documentation	Not applicable
scheduling strategy	(no internal scheduling policy)
[BSW172] Compatibility and documentation of	Not applicable
	only)
of configuration parameters	(all configuration parameters are single instance
[BSW00401] Documentation of multiple instances	Not applicable
	specification)
	(requirement on documentation, not on
[BSW009] Module User Documentation	Not applicable
[BSW00331] Separation of error and status values	
	specification)
instead of functions	(requirement on implementation, not for
[BSW00330] Usage of macros / inline functions	Not applicable
[201100020] / World and Or goriono interfaces	(explicit interfaces defined)
[BSW00329] Avoidance of generic interfaces	Chapter 8.3
	routines)
[201100000] Farameters of campack functions	(this module does not provide any callback
[BSW00360] Parameters of callback functions	Not applicable
	routines)
[200000] Notain type of ballback full officers	(this module does not provide any callback
[BSW00359] Return type of callback functions	Not applicable
processing functions	
[BSW00376] Return type and parameters of main	Chapter 8.5.1
[BSW00414] Parameter of init function	Chapter 8.3.1, FEE072
[BSW00358] Return type of init() functions	Chapter 8.3.1
	(no function pointers in this specification)
[BSW00371] Do not pass function pointers via API	Not applicable
	specification)
	(requirement on implementation, not for
[BSW00309] Global data with read-only constraint	Not applicable
	specification)
,	(requirement on implementation, not for
[BSW00308] Definition of global data	Not applicable
	specification)
platform specific keywords	(requirement on implementation, not for
[BSW00306] Avoid direct use of compiler and	Not applicable
	specification)
2 91 -	(requirement on implementation, not for
[BSW00378] AUTOSAR boolean type	Not applicable
	specification)
data types	(requirement on implementation, not for
[BSW00355] Do not redefine AUTOSAR integer	Not applicable

specification)

Document: General Requirements on SPAL

Requirement	Satisfied by
[BSW12263] Object code compatible	Not applicable
configuration concept	(this module does not provide any post-build
	parameters)
[BSW12056] Configuration of notification	Not applicable
mechanisms	(this module does not provide any notification
	mechanisms)
[BSW12267] Configuration of wake-up sources	Not applicable
	(this module does not provide any wakeup
TD014400==1.D.i.	capabilities)
[BSW12057] Driver module initialization	FEE085
[BSW12125] Initialization of hardware resources	Not applicable
IDOMAN AND DELICATION AND AND AND AND AND AND AND AND AND AN	(this module has no direct hardware access)
[BSW12163] Driver module de-initialization	Not applicable
	(this module does not provide any shutdown
TD 014/400 T011	capabilities)
[BSW12058] Individual initialization of overall	Not applicable
registers	(this module has no direct hardware access)
[BSW12059] General initialization of overall	Not applicable
registers	(this module has no direct hardware access)
[BSW12060] Responsibility for initialization of	Not applicable
one-time writable registers	(this module has no direct hardware access)
[BSW12461] Responsibility for register	Not applicable
initialization	(this module has no direct hardware access)
[BSW12462] Provide settings for register	Not applicable
initialization	(this module has no direct hardware access)
[BSW12463] Combine and forward settings for	Not applicable
register initialization	(this module has no direct hardware access)
[BSW12062] Selection of static configuration sets	Not applicable (no selectable of configuration sets)
[BSW12068] MCAL initialization sequence	Not applicable
[B3W 12000] WCAL IIIItialization sequence	(this module belongs to the ECU abstraction
	layer)
[BSW12069] Wake-up notification of ECU State	Not applicable
Manager	(this module does not provide any wakeup
Managor	capabilities)
[BSW157] Notification mechanisms of drivers and	Not applicable
handlers	(this module does not provide any notification
	mechanisms)
[BSW12155] Prototypes of callback functions	Not applicable
, ,,	(this module does not implement any callback
	routines)
[BSW12169] Control of operation mode	FEE020
[BSW12063] Raw value mode	Not applicable
-	(this module does not handle or mishandle any
	data)

BSW14018 Scope of Flash EEPROM Emulation	Chapter 1

7 Functional specification

7.1 General behavior

7.1.1 Addressing scheme and segmentation

The Flash EEPROM Emulation (FEE) module provides upper layers with a 32bit virtual linear address space and uniform segmentation scheme. This virtual 32bit addresses shall consist of

- a 16bit block number allowing a (theoretical) number of 65536 logical blocks
- a 16bit block offset allowing a (theoretical) block size of 64KByte per block

The 16bit block number represents a configurable (virtual) paging mechanism. The values for this address alignment can be derived from that of the underlying flash driver and device. This virtual paging shall be configurable via the parameter FeeVirtualPageSize.

[FEE076] 「The configuration of the Fee module shall be such that the virtual page size (defined in FeeVirtualPageSize) is an integer multiple of the physical page size, i.e. it is not allowed to configure a smaller virtual page than the actual physical page size. 」(BSW14001, BSW14005)

Note: This specification requirement allows the physical start address of a logical block to be calculated rather than making a lookup table necessary for the address mapping.

Example:

The size of a virtual page is configured to be eight bytes, thus the address alignment is eight bytes. The logical block with block number 1 is placed at physical address x. The logical block with the block number 2 then would be placed at x+8, block number 3 would be placed at x+16.

[FEE005] [Each configured logical block shall take up an integer multiple of the configured virtual page size (see also Chapter 10.2 configuration parameter FeeVirtualPageSize). J(BSW14001)

Example:

The address alignment / virtual paging is configured to be eight bytes by setting the parameter <code>FeeVirtualPageSize</code> accordingly. The logical block number 1 is configured to have a size of 32 bytes (seeFigure 3). This logical block would use exactly 4 virtual pages. The next logical block thus would get the block number 5, since block numbers 2, 3 and 4 are "blocked" by the first logical block. This second block is configured to have a size of 100 bytes, taking up 13 virtual pages and

leaving 4 bytes of the last page unused. The next available logical block number thus would be 17.

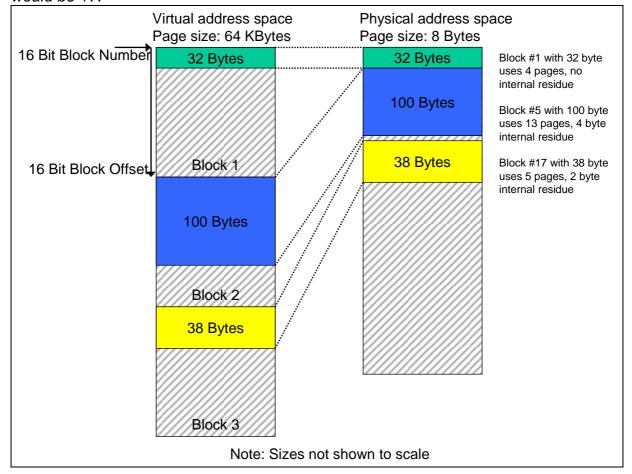

Figure 3: Virtual vs. physical memory layout

[FEE071] \(\text{ Logical blocks must not overlap each other and must not be contained within one another. \(\text{\ (BSW14001)} \)

[FEE006] ☐ The block numbers 0x0000 and 0xFFFF shall not be configurable for a logical block. 」(BSW14026)

7.1.2 Address calculation

[FEE007] [Depending on the implementation of the FEE module and the exact address format used, the functions of the FEE module shall combine the 16bit block number and 16bit address offset to derive the physical flash address needed for the underlying flash driver. <code>_(BSW14009)</code>

Note: The exact address format needed by the underlying flash driver and therefore the mechanism how to derive the physical flash address from the given 16bit block

number and 16bit address offset depends on the flash device and the implementation of this module and shall therefore not be standardized.

[FEE100] [Only those bits of the 16bit block number, that do not denote a specific dataset or redundant copy shall be used for address calculation. |()

Note: Since this information is needed by the NVRAM manager, the number of bits to encode this can be configured for the NVRAM manager with the parameter NVM_DATASET_SELECTION_BITS.

Example:

Dataset information is configured to be encoded in the four LSB's of the 16bit block number (allowing for a maximum of 16 datasets per NVRAM block and a total of 4094 NVRAM blocks). An implementer decides to store all datasets of a NVRAM block directly adjacent and using the length of the block and a pointer to access each dataset. To calculate the start address of the block (the address of the first dataset) she/he uses only the 12 MSB's, to access a specific dataset she/he adds the size of the block multiplied by the dataset index (the four MSB's) to this start address (Figure 4).

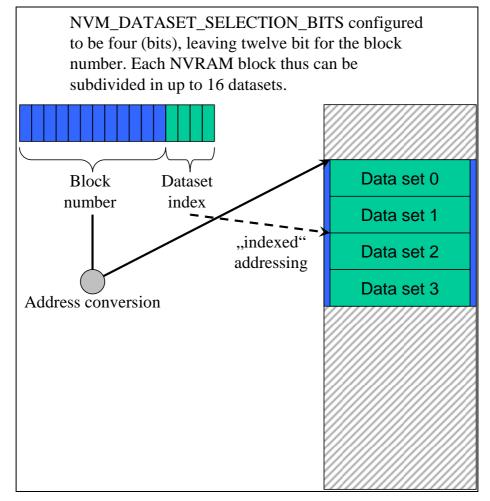

Figure 4: Block number and dataset index

7.1.3 Limitation of erase cycles

[FEE102] [The configuration of the FEE module shall define the expected number of erase/write cycles for each logical block in the configuration parameter FeeNumberOfWriteCycles. J(BSW14002, BSW14012)

[FEE103] [If the underlying flash device or device driver does not provide at least the configured number of erase/write cycles per physical memory cell, the FEE module shall provide mechanisms to spread the write access such that the physical device is not overstressed. This shall also apply to all management data used internally by the FEE module. (BSW14002, BSW14012)

Example:

The logical block number 1 is configured for an expected 500.000 write cycles, the underlying flash device and device driver are only specified for 100.000 erase cycles. In this case, the FEE module has to provide (at least) five separate memory areas and alternate the access between those areas internally so that each physical memory location is only erased for a maximum of the specified 100.000 cycles.

7.1.4 Handling of "immediate" data

[FEE009] F Blocks containing immediate data have to be written instantaneously, i.e. the FEE module has to ensure that it can write such blocks without the need to erase the corresponding memory area (e.g. by using pre-erased memory) and that the write request is not delayed by currently running module internal management operations. (BSW14013)

Note: An ongoing lower priority read / erase / write or compare job shall be canceled by the NVRAM manager before immediate data is written. The FEE module has only to ensure that this write request can be performed immediately.

Note: A running operation on the hardware (e.g. writing one page or erasing one sector) can usually not be aborted once it has been started. The maximum time of the longest hardware operation thus has to be accepted as delay even for immediate data.

Example:

Three blocks with 10 bytes each have been configured for immediate data. The FEE module / configuration tool reserves these 30 bytes (plus the implementation specific overhead per block / page if needed) for use by this immediate data only. That is, this memory area shall not be used for storage of other data blocks.

Now, the NVRAM manager has requested the FEE module to write a data block of 100 bytes. While this block is being written, a situation occurs that one (or several) of the immediate data blocks need to be written. Therefore the NVRAM manager cancels the ongoing write request and subsequently issues the write request for the (first) block containing immediate data. The cancelation of the ongoing write request is performed synchronously by the FEE module and the underlying flash driver (i.e. the write request for the immediate data) can be started without any further delay. However, before the first bytes of immediate data can be written, the FEE module or rather the underlying flash driver have to wait for the end of an ongoing hardware access from the previous write request (e.g. writing of a page, erasing of a sector, transfer via SPI, ...).

7.1.5 Managing block correctness information

[FEE049] [[] The FEE module shall manage for each block the information, whether this block is correct (i.e. "not corrupted") from the point of view of the FEE module or not. This information shall only concern the internal handling of the block, not the block's contents. (BSW14014)

[FEE153] □ When a block write operation is started, the FEE module shall mark the corresponding block as "corrupted"¹. (BSW14014)

28 of 67

¹ This does not necessarily mean a write operation on the physical device, if there are other means to detect the consistency of a logical block.

[FEE154] \(\text{Upon the successful end of the block write operation, the block shall be marked as "not corrupted" (again). \(\text{(BSW14014)} \)

Note: This internal management information should not be mixed up with the validity information of a block which can be manipulated by using the Fee_InvalidateBlock service, i.e. the FEE shall be able to distinguish between a corrupted block and a block that has been deliberately invalidated by the upper layer.

7.2 Error classification

[FEE047] 「 Values for production code Event Ids are assigned externally by the configuration of the Dem. They are published in the file <code>Dem_IntErrId.h</code> and included via <code>Dem.h.</code> <code>J(BSW00409)</code>

[FEE048] [Development error values are of type uint8.]()

[FEE010] For the FEE module shall detect the following errors and exceptions depending on its configuration (development/production):

Type or error	Relevance	Related error code	Value [hex]
API service called when	Development	FEE_E_UNINIT	0x01
module was not initialized			
API service called with	Development	FEE_E_INVALID_BLOCK_NO	0x02
invalid block number			
API service called with	Development	FEE_E_INVALID_BLOCK_OFS	0x03
invalid block offset			
API service called with	Development	FEE_E_INVALID_DATA_PTR	0x04
invalid data pointer			
API service called with	Development	FEE_E_INVALID_BLOCK_LEN	0x05
invalid length information			
API service called while	Development	FEE_E_BUSY	0x06
module is busy processing a			
user request			
API service called while	Development	FEE_E_BUSY_INTERNAL	0x07
module is busy doing			
internal management			
operations.			
Fee_Cancel called while no	Development	FEE_E_INVALID_CANCEL	0x08
job was pending.			

(BSW00406, BSW00337, BSW00386, BSW00327, BSW00331)

Note: The error FEE_E_BUSY_INTERNAL is not caused by a misbehaviour of the software but rather by a wrong (or better unlucky) timing of function calls. Therefore it shall only be a development error, even though this behaviour may also be observed in a production system.

Note: The error FEE_BUSY_INTERNAL shall only be reported, if the internal management operation cannot be suspended or aborted (see e.g. <u>FEE173</u>). Whether an internal management operation can be suspended or aborted depends first on the underlying hardware (flash technology) and second on the implementation of the FEE (design decision of the software implementor / customer).

7.3 Error detection

[FEE011] [The detection of development errors is configurable (*ON / OFF*) at precompile time. The switch FeeDevErrorDetect (see Chapter 10) shall activate or deactivate the detection of all development errors. J(BSW00338, BSW00386, BSW00350)

[FEE062] [If the FeeDevErrorDetect switch is enabled, API parameter checking is enabled. The detailed description of the detected errors can be found in chapter 7.2 and chapter 10.2. (BSW00350)

[FEE063] [The detection of production code errors cannot be switched off.]()

7.4 Error notification

[FEE106] [Production errors shall be reported to Diagnostic Event Manager. ()

7.5 Consistency checks

[FEE013] [The Fee module shall perform inter module checks to avoid integration of incompatible files: all included header files shall be checked by pre-processing directives. The Fee module shall thereby verify that <MODULENAME>_AR_RELEASE_MAJOR_VERSION and <MODULENAME>_AR_RELEASE_MINOR_VERSION are identical to the expected values, where <MODULENAME> is the module abbreviation of the external module. which provides the included header file. If the values are not identical, an error shall be raised at compile time. (BSW004)

Note: The configuration tool shall check all configuration parameters for being within the expected bounds. Also the dependencies between configuration parameters shall be checked by the configuration tool during system generation or during the build process (for details see chapter 10).

7.6 Support for Debugging

[FEE130] \(\text{The modules status, the job result and the block meta information (see \(\frac{FEE049}{} \) shall be made available for debugging (reading). Therefore those variables shall be implemented as global variables. \(\frac{1}{2} \)

[FEE131] \(\text{ The type definitions and declarations of all variables which shall be used for debugging shall be given in the modules header file \(\text{Fee.h.} \) \(\)()

[FEE132] \[All variables which shall be used for debugging shall be described in detail in the modules description file. \(\)()

8.2 Type definitions

No local type definitions needed for this module.

8.3 Function definitions

8.3.1 Fee_Init

[FEE085]

Г

Service name:	Fee_Init
Syntax:	void Fee_Init(
	void
Service ID[hex]:	0x00
Sync/Async:	Asynchronous
Reentrancy:	Non Reentrant
Parameters (in):	None
Parameters	None
(inout):	
Parameters (out):	None
Return value:	None

(BSW101, BSW12057)

[FEE120] [The function Fee_Init shall set the module state from MEMIF_UNINIT to MEMIF_BUSY_INTERNAL once it starts the module's initialization.](BSW00406)

[FEE168] [If initialization is finished within Fee_Init, the function Fee_Init shall set the module state from MEMIF_BUSY_INTERNAL to MEMIF_IDLE once initialization has been successfully finished.]()

Note: The FEE module's environment shall not call the function Fee_Init during a running operation of the FEE module.

8.3.2 Fee_SetMode

[FEE086]

Г

Service name:	Fee_SetMode				
Syntax:	void Fee_SetMode(
	<pre>MemIf_ModeType Mode)</pre>				
Service ID[hex]:	0x01				
Sync/Async:	Synchronous				
Reentrancy:	Non Reentrant				
Parameters (in):	Mode	Desired mode for the underlying flash driver			
Parameters	None				
(inout):					
Parameters (out):	None				
Return value:	None				
Description:	Service to	o call the Fls_SetMode function of the underlying flash driver.			

1()

[FEE020] [If the current module status is MEMIF_IDLE and if supported by the underlying hardware and device driver, the function Fee_SetMode shall call the function Fls_SetMode of the underlying flash driver with the given "Mode" parameter. J(BSW12169)

Example: During normal operation of an ECU the FEE module and underlying device driver shall use as few (runtime) resources as possible, therefore the flash driver is switched to "slow" mode. During startup and especially during shutdown it might be desirable to read / write the NV memory blocks as fast as possible, therefore the FEE and the underlying device driver could be switched into "fast" mode.

[FEE121] 「 If development error detection is enabled for the module: the function Fee_SetMode shall check if the module status is MEMIF_UNINIT. If this is the case,

the function Fee_SetMode shall raise the development error FEE_E_UNINIT and return to the caller without executing the mode switch. (BSW00406)

[FEE170] 「 If development error detection is enabled for the module: the function Fee_SetMode shall check if the module state is MEMIF_BUSY. If this is the case, the function Fee_SetMode shall raise the development error FEE_E_BUSY and return to the caller without executing the mode switch. |()

[FEE171] 「 If development error detection is enabled for the module: the function Fee_SetMode shall check if the module state is MEMIF_BUSY_INTERNAL. If this is the case, the function Fee_SetMode shall raise the development error FEE_E_BUSY_INTERNAL and return to the caller without executing the mode switch. I()

8.3.3 Fee Read

[FEE087]

Г

Service name:	Fee Read				
Syntax:	Std_ReturnType Fee_Read(
Зуппах.					
	uint16 BlockNumber,				
	uint16 BlockOffset, uint8* DataBufferPtr, uint16 Length				
)				
Service ID[hex]:	0x02				
Sync/Async:	Asynchronous				
Reentrancy:	Non Reentrant				
Parameters (in):	BlockNumber	Number of logical block, also denoting start address of that block			
		in flash memory.			
	BlockOffset	Read address offset inside the block			
	Length	Number of bytes to read			
Parameters	None				
(inout):					
Parameters (out):	DataBufferPtr	Pointer to data buffer			
	Std_ReturnTypeE_OK: The requested job has been accepted by the module.				
Return value:		E_NOT_OK: The requested job has not been accepted by the			
		module.			
Description:	Service to initiate a read job.				

(BSW14029)

[FEE021] [The function Fee_Read shall take the block start address and offset and calculate the corresponding memory read address.](BSW14007, BSW14008)

Note: The address offset and length parameter can take any value within the given types range. This allows reading of an arbitrary number of bytes from an arbitrary start address inside a logical block.

[FEE022] [If the current module status is MEMIF_IDLE or if the current module status is MEMIF_BUSY INTERNAL and the internal management operation can be suspended or aborted, the function Fee_Read shall accept the read request, copy the given / computed parameters to module internal variables, initiate a read job, set the FEE module status to MEMIF_BUSY, set the job result to MEMIF_JOB_PENDING and return with E_OK. |()

[FEE172] 「 If the current module status is MEMIF_UNINIT or MEMIF_BUSY or MEMIF_BUSY_INTERNAL and the internal management operation can't be suspended or aborted, the function Fee_Read shall reject the job request and return with E_NOT_OK. |()

[FEE073] \(\text{ The FEE module shall execute the read operation asynchronously within the FEE module's main function. \(\)()

[FEE122] [If development error detection is enabled for the module: the function Fee_Read shall check if the module state is MEMIF_UNINIT. If this is the case, the function Fee_Read shall reject the read request, raise the development error FEE_E_UNINIT and return with E_NOT_OK. | (BSW00406)

[FEE133] [If development error detection is enabled for the module: the function Fee_Read shall check if the module state is MEMIF_BUSY. If this is the case, the function Fee_Read shall reject the read request, raise the development error FEE_E_BUSY and return with E_NOT_OK.]()

[FEE173] [If development error detection is enabled for the module: if the current module status is MEMIF_BUSY_INTERNAL and if it is not possible to suspend or abort the internal management operation (because of data consistency / module implementation / hardware restrictions), the function Fee_Read shall reject the read request, raise the development error FEE_E_BUSY_INTERNAL and return with E_NOT_OK. J()

[FEE134] Γ If development error detection is enabled for the module: the function Fee_Read shall check that the given block number is valid (i.e. it has been configured). If this is not the case, the function Fee_Read shall reject the read request, raise the development error FEE_E_INVALID_BLOCK_NO and return with E_NOT_OK. Γ ()

[FEE135] [If development error detection is enabled for the module: the function Fee_Read shall check that the given block offset is valid (i.e. that it is less than the block length configured for this block). If this is not the case, the function Fee_Read

shall reject the read request, raise the development error FEE_E_INVALID_BLOCK_OFS and return with E_NOT_OK. J()

[FEE136] 「 If development error detection is enabled for the module: the function Fee_Read shall check that the given data pointer is valid (i.e. that it is not NULL). If this is not the case, the function Fee_Read shall reject the read request, raise the development error FEE_E_INVALID_DATA_PTR and return with E_NOT_OK. J()

[FEE137] \(\text{If development error detection is enabled for the module: the function } \) \(\text{Fee}_Read \) shall check that the given length information is valid, i.e. that the requested length information plus the block offset do not exceed the block end address (block start address plus configured block length). If this is not the case, the function \(\text{Fee}_Read \) shall reject the read request, raise the development error \(\text{FEE}_E_INVALID_BLOCK_LEN \) and return with \(E_NOT_OK_I() \)

[FEE162] If a read request is rejected by the function Fee_Read, i.e. requirements <u>FEE122</u>, <u>FEE133</u>, <u>FEE134</u>, <u>FEE135</u>, <u>FEE136</u>, <u>FEE137</u> or <u>FEE173</u> apply, the function Fee_Read shall not change the current module status or job result. ()

8.3.4 Fee Write

[FEE088]

Γ

o <i>'</i>	= 147.			
Service name:	Fee_Write			
Syntax:	Std_ReturnType Fee_Write(
	uint16 BlockNumber,			
	uint8* DataBufferPtr			
Service ID[hex]:	0x03			
Sync/Async:	Asynchronous			
Reentrancy:	Non Reentrant			
	BlockNumber Number of logical block, also denoting start address of that block			
Parameters (in):	in EEPROM.			
. ,	DataBufferPtr Pointer to data buffer			
Parameters	None			
(inout):				
Parameters (out):	None			
	Std_ReturnTypeE_OK: The requested job has been accepted by the module.			
Return value:	E_NOT_OK: The requested job has not been accepted by the			
	module.			
Description:	Service to initiate a write job.			

(BSW14010)

[FEE024] \(\text{The function Fee_Write shall take the block start address and calculate the corresponding memory write address. The block address offset shall be fixed to zero. \(\text{(BSW14006)} \)

[FEE025] [If the current module status is MEMIF_IDLE or if the current module status is MEMIF_BUSY INTERNAL and the internal management operation can be suspended or aborted, the function Fee_Write shall accept the write request, copy the given / computed parameters to module internal variables, initiate a write job, set the FEE module status to MEMIF_BUSY, set the job result to MEMIF_JOB_PENDING and return with E_OK.]()

[FEE174] 「 If the current module status is MEMIF_UNINIT or MEMIF_BUSY or MEMIF_BUSY_INTERNAL and the internal management operation can't be suspended or aborted, the function Fee_Write shall reject the job request and return with E NOT OK. |()

[FEE183] Γ If the write request addresses a block containing immediate data, the function Fee_Write shall accept the write request, even if the current module status is MEMIF_BUSY_INTERNAL and the internal management operation can't be suspended or aborted. Γ

Note: In this case the internal management operation shall be aborted without the chance to restart it and with the risk of unrecoverable errors for the "normal" data.

[FEE026] \(\text{The FEE module shall execute the write operation asynchronously within the FEE module's main function. \(\)()

[FEE123] [If development error detection is enabled for the module: the function Fee_Write shall check if the module state is MEMIF_UNINIT. If this is the case, the function Fee_Write shall reject the write request, raise the development error FEE E UNINIT and return with E NOT OK. | (BSW00406)

[FEE144] [If development error detection is enabled for the module: the function Fee_Write shall check if the module state is MEMIF_BUSY. If this is the case, the function Fee_Write shall reject the write request, raise the development error FEE_E_BUSY and return with E_NOT_OK. |()

[FEE175] [If development error detection is enabled for the module: if the current module status is MEMIF_BUSY_INTERNAL and if it is not possible to suspend or abort the internal management operation (because of data consistency / module implementation / hardware restrictions), the function Fee_Write shall reject the write

[FEE138] Γ If development error detection is enabled for the module: the function Fee_Write shall check that the given block number is valid (i.e. it has been configured). If this is not the case, the function Fee_Write shall reject the write request, raise the development error FEE_E_INVALID_BLOCK_NO and return with E_NOT_OK. \rfloor ()

[FEE139] [If development error detection is enabled for the module: the function Fee_Write shall check that the given data pointer is valid (i.e. that it is not NULL). If this is not the case, the function Fee_Write shall reject the write request, raise the development error FEE E INVALID DATA PTR and return with E NOT OK. ()

[FEE163] $\[\]$ If a write request is rejected by the function Fee_Write, i.e. requirements <u>FEE123</u>, <u>FEE144</u>, <u>FEE138</u>, <u>FEE139</u> or <u>FEE175</u> apply, the function Fee_Write shall not change the current module status or job result. $\[\]$ ()

8.3.5 Fee_Cancel

[FEE089]

Γ

Service name:	Fee Cancel
	_
Syntax:	<pre>void Fee_Cancel(</pre>
	void
Service ID[hex]:	0x04
Sync/Async:	Synchronous
Reentrancy:	Non Reentrant
Parameters (in):	None
Parameters	None
(inout):	
Parameters (out):	None
Return value:	None
Description:	Service to call the cancel function of the underlying flash driver.

(BSW14031)

Note: The function Fee_Cancel and the cancel function of the underlying flash driver are – from their behaviour – synchronous functions but they are asynchronous w.r.t. an ongoing read, erase or write job in the flash memory. The cancel functions shall only reset their modules internal variables so that a new job can be accepted by

the modules. They do not cancel an ongoing job in the hardware and they do not wait for an ongoing job to be finished by the hardware. This might lead to the situation in which the module's state is reported as MEMIF_IDLE while there is still an ongoing job being executed by the hardware. Therefore, the flash driver's main function shall check that the hardware is indeed free before starting a new job (see chapter 9.4 for a detailed sequence diagram).

Note: The function Fee_Cancel should only be used by the NvM to abort a read or write request for an NV block if higher priority data (i.e. immediate data) has to be written.

[FEE124] 「 If development error detection is enabled for the module: the function Fee_Cancel shall check if the module state is MEMIF_UNINIT. If this is the case the function Fee_Cancel shall raise the development error FEE_E_UNINIT and return to the caller without changing any internal variables. |(BSW00406)

[FEE080] [If the current module status is MEMIF_BUSY (i.e. the request to cancel a pending job is accepted by the function Fee_Cancel), the function Fee_Cancel shall call the cancel function of the underlying flash driver. ()

[FEE081] [If the current module status is MEMIF_BUSY (i.e. the request to cancel a pending job is accepted by the function Fee_Cancel), the function Fee_Cancel shall reset the FEE module's internal variables to make the module ready for a new job request from the upper layer, i.e. it shall set the module status to MEMIF_IDLE.

1()

[FEE164] [If the current module status is not MEMIF_BUSY (i.e. the request to cancel a pending job is rejected by the function Fee_Cancel), the function Fee_Cancel shall not change the current module status or job result. |()

[FEE184] \(\) If the current module status is not MEMIF_BUSY (i.e. there is no job to cancel and therefore the request to cancel a pending job is rejected by the function Fee_Cancel), the function Fee_Cancel shall raise the development error FEE_E_INVALID_CANCEL. \(\)()

8.3.6 Fee GetStatus

[FEE090]

Service name:	Fee_GetStatus
Syntax:	MemIf_StatusType Fee_GetStatus(void)

Service ID[hex]:	0x05	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	None	
Parameters	None	
(inout):		
Parameters (out):	None	
Return value:	MemIf_StatusTypeMEMIF_UNINIT: The FEE module has not been initialized. MEMIF_IDLE: The FEE module is currently idle. MEMIF_BUSY: The FEE module is currently busy. MEMIF_BUSY_INTERNAL: The FEE module is busy with internal management operations.	
Description:	Service to return the status.	

1()

[FEE034] [The function Fee_GetStatus shall return MEMIF_UNINIT if the module has not (yet) been initialized.]()

[FEE128] [The function Fee_GetStatus shall return MEMIF_IDLE if the module is neither processing a request from the upper layer nor is it doing an internal management operation.]()

[FEE129] \(\text{The function Fee_GetStatus shall return MEMIF_BUSY if it is currently processing a request from the upper layer. \(\)()

[FEE074] [The function Fee_GetStatus shall return MEMIF_BUSY_INTERNAL, if an internal management operation is currently ongoing.]()

Note: Internal management operation may e.g. be a re-organization of the used flash memory (garbage collection). This may imply that the underlying device driver is – at least temporarily – busy.

8.3.7 Fee_GetJobResult

[FEE091]

г

Service name:	Fee_GetJobResult	
Syntax:	MemIf_JobResultType Fee_GetJobResult(
	void	
Service ID[hex]:	0x06	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	None	
Parameters	None	
(inout):		
Parameters (out):	None	
Return value:	Memlf_JobResultTypeMEMIF_JOB_OK: The last job has been finished	

Specification of Flash EEPROM Emulation V2.0.0 R4.0 Rev 3

	successfully. MEMIF_JOB_PENDING: The last job is waiting for execution or currently being executed. MEMIF_JOB_CANCELED: The last job has been canceled (which means it failed). MEMIF_JOB_FAILED: The last job has not been finished successfully (it failed). MEMIF_BLOCK_INCONSISTENT: The requested block is inconsistent, it may contain corrupted data. MEMIF_BLOCK_INVALID: The requested block has been invalidated, the requested read operation can not be performed.
Description:	Service to query the result of the last accepted job issued by the upper layer software.

]()

[FEE035] [The function Fee_GetJobResult shall return MEMIF_JOB_OK if the last job has been finished successfully.]()

[FEE156] [The function Fee_GetJobResult shall return MEMIF_JOB_PENDING if the requested job is still waiting for execution or is currently being executed.]()

[FEE157] [The function Fee_GetJobResult shall return MEMIF_JOB_CANCELED if the last job has been canceled by the upper layer.]()

[FEE158] \(\text{ The function Fee_GetJobResult shall return MEMIF_JOB_FAILED if the last job has failed. \(\)()

[FEE160] [The function Fee_GetJobResult shall return MEMIF_BLOCK_INVALID if the requested block has been invalidated by the upper layer. |()

[FEE155] [Only those jobs which have been requested directly by the upper layer shall have influence on the job result returned by the function <code>Fee_GetJobResult</code>. I.e. jobs which are issued by the FEE module itself in the course of internal management operations shall not alter the job result. |()

[FEE125] [If development error detection is enabled for the module: the function Fee_GetJobResult shall check if the module state is MEMIF_UNINIT. If this is the

case, the function Fee_GetJobResult shall raise the development error FEE_E_UNINIT and return with MEMIF_JOB_FAILED. |(BSW00406)

8.3.8 Fee InvalidateBlock

[FEE092]

Γ

Service name:	Fee_InvalidateBlock	
Syntax:	Std_ReturnType Fee_InvalidateBlock(uint16 BlockNumber)	
Service ID[hex]:	0x07	
Sync/Async:	Asynchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	BlockNumber of logical block, also denoting start address of that block in flash memory.	
Parameters (inout):	None	
Parameters (out):	None	
Return value:	Std_ReturnType E_OK: The requested job has been accepted by the module. E_NOT_OK - only if DET is enabled: The requested job has not been accepted by the module.	
Description:	Service to invalidate a logical block.	

(BSW14028)

[FEE036] [The function Fee_InvalidateBlock shall take the block number and calculate the corresponding memory block address. |()

[FEE037] [The function Fee_InvalidateBlock shall invalidate the requested block <BlockNumber> by calling the erase function of the underlying device driver and / or by changing some module internal management information accordingly. |()

Note: How exactly the requested block is invalidated depends on the module's implementation and will not be further detailed in this specification. The internal management information has to be stored in NV memory since it has to be resistant against resets. What this information is and how it is stored will not be further detailed in this specification.

[FEE176] Γ If the current module status is not MEMIF_IDLE, the function Fee_InvalidateBlock shall reject the invalidation request and return with E_NOT_OK. I()

[FEE126] [If development error detection is enabled for the module: the function Fee_InvalidateBlock shall check if the module status is MEMIF_UNINIT. If this is the case, the function Fee_InvalidateBlock shall reject the invalidation

request, raise the development error FEE_E_UNINIT and return with E_NOT_OK.](BSW00406)

[FEE145] 「 If development error detection is enabled for the module: the function Fee_InvalidateBlock shall check if the module status is MEMIF_BUSY. If this is the case, the function Fee_InvalidateBlock shall reject the request, raise the development error FEE_E_BUSY and return with E_NOT_OK. |()

[FEE177] [If development error detection is enabled for the module: if the current module status is MEMIF_BUSY_INTERNAL and if it is not possible to suspend or abort the internal management operation (because of data consistency / module implementation / hardware restrictions), the function Fee_InvalidateBlock shall reject the invalidation request, raise the development error FEE_E_BUSY_INTERNAL and return with E_NOT_OK. |()

[FEE140] [If development error detection is enabled for the module: the function Fee_InvalidateBlock shall check that the given block number is valid (i.e. it has been configured). If this is not the case, the function Fee_InvalidateBlock shall reject the request, raise the development error FEE_E_INVALID_BLOCK_NO and return with E_NOT_OK. |()

[FEE165]
If an invalidation request is rejected by the function Fee_InvalidateBlock, i.e. requirements FEE126, FEE140, FEE145 or FEE177 apply, the function Fee_InvalidateBlock shall not change the current module status or job result. ()

8.3.9 Fee_GetVersionInfo

[FEE093]

Γ

Service name:	Fee_GetVersionInf	0
Syntax:	void Fee_GetVersionInfo(
	Std_Versio	nInfoType* VersionInfoPtr
)	
Service ID[hex]:	0x08	
Sync/Async:	Synchronous	
Reentrancy:	Reentrant	
Parameters (in):	None	
Parameters	None	
(inout):		
Parameters (out):	VersionInfoPtr	Pointer to standard version information structure.
Return value:	None	
Description:	Service to return th	e version information of the FEE module.

[FEE064] [The function Fee_GetVersionInfo shall return the version information of the FEE module. The version information includes:

- Module Id
- Vendor Id
- Vendor specific version numbers (BSW00407). (1)

[FEE065] [The function Fee_GetVersionInfo shall be pre-compile time configurable On/Off by the configuration parameter FeeVersionInfoApi.]()

[FEE082] [If source code for caller and callee of the function Fee_GetVersionInfo is available, the FEE module should realize this function as a macro. The FEE module should define this macro in the module's header file. |()

[FEE147] [If development error detection is enabled for the module: the function Fee_GetVersionInfo shall check that the given data pointer is valid (i.e. that it is not NULL). If this is not the case, the function Fee_GetVersionInfo shall raise the development error FEE_E_INVALID_DATA_PTR. |()

8.3.10 Fee_EraseImmediateBlock

[FEE094]

Γ

Service name:	Fee_EraseImmediateBlock	
Syntax:	Std_ReturnType Fee_EraseImmediateBlock(uint16 BlockNumber	
Camina IDIInavila	000	
Service ID[hex]:	0x09	
Sync/Async:	Asynchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	BlockNumber of logical block, also denoting start address of that block in EEPROM.	
Parameters (inout):	None	
Parameters (out):	None	
Return value:	Std_ReturnType E_OK: The requested job has been accepted by the module. E_NOT_OK - only if DET is enabled: The requested job has not been accepted by the module.	
Description:	Service to erase a logical block.	

(BSW14032)

Note: The function Fee_EraseImmediateBlock shall only be called by e.g. diagnostic or similar system service to pre-erase the area for immediate data if necessary.

[FEE066] [The function Fee_EraseImmediateBlock shall take the block number and calculate the corresponding memory block address.]()

[FEE067] The function Fee_EraseImmediateBlock shall ensure that the FEE module can write immediate data. Whether this involves physically erasing a memory area and therefore calling the erase function of the underlying driver depends on the implementation of the module. |()

[FEE127] Γ If development error detection is enabled for the module: the function Fee_EraseImmediateBlock shall check if the module state is MEMIF_UNINIT. If this is the case, the function Fee_EraseImmediateBlock shall reject the erase request, raise the development error FEE_E_UNINIT and return with E_NOT_OK. Γ (BSW00406)

[FEE146] [If development error detection is enabled for the module: the function Fee_EraseImmediateBlock shall check if the module state is MEMIF_BUSY. If this is the case, the function Fee_EraseImmediateBlock shall reject the erase request, raise the development error FEE E BUSY and return with E NOT OK. ()

[FEE178] [If development error detection is enabled for the module: if the current module status is MEMIF_BUSY_INTERNAL and if it is not possible to suspend or abort the internal management operation (because of data consistency / module implementation / hardware restrictions), the function Fee_EraseImmediateBlock shall reject the request, raise the development error FEE_E_BUSY_INTERNAL and return with E_NOT_OK. |()

[FEE068] 「 If development error detection is enabled for the module: the function Fee_EraseImmediateBlock shall check whether the addressed logical block is configured as containing immediate data (FeeImmediateData == TRUE). If not, the function Fee_EraseImmediateBlock shall raise the development error FEE_E_INVALID_BLOCK_NO and return E_NOT_OK without erasing the addressed logical block. 」(BSW12448)

[FEE141] [If development error detection is enabled for the module: the function Fee_EraseImmediateBlock shall check that the given block number is valid (i.e. it has been configured). If this is not the case, the function Fee_EraseImmediateBlock shall reject the erase request, raise the development error FEE_E_INVALID_BLOCK_NO and return with E_NOT_OK.]()

[FEE166] [If a erase request is rejected by the function Fee_EraseImmediateBlock, i.e. requirements FEE068, FEE127, FEE141, FEE146 or FEE178 apply, the function Fee_EraseImmediateBlock shall not change the current module status or job result.]()

8.4 Call-back notifications

This chapter lists all functions provided by the Fee module to lower layer modules.

[FEE069] Γ The FEE module shall provide function prototypes of the callback functions in the file Fee_Cbk.h | (BSW00325)

Note: Depending on the implementation of the modules making up the NV memory stack, callback routines provided by the FEE module may be called on interrupt level. The implementation of the FEE module therefore has to make sure that the runtime of those routines is reasonably short, i.e. since callbacks may be propagated upward through several software layers. Whether callback routines are allowable / feasible on interrupt level depends on the project specific needs (reaction time) and limitations (runtime in interrupt context). Therefore, system design has to make sure that the configuration of the involved modules meets those requirements.

8.4.1 Fee_JobEndNotification

[FEE095]

Service name: Fee JobEndNotification void Fee JobEndNotification(Syntax: void Service ID[hex]: 0x10 Sync/Async: Synchronous Reentrancy: Non Reentrant Parameters (in): None **Parameters** None (inout): Parameters (out): None Return value: None

Service to report to this module the successful end of an asynchronous operation.

]()

Description:

The underlying flash driver shall call the function Fee_JobEndNotification to report the successful end of an asynchronous operation.

[FEE052] [The function Fee_JobEndNotification shall perform any necessary block management operations and subsequently call the job end notification routine of the upper layer module if configured. ()

[FEE142] If the job result is currently MEMIF_JOB_PENDING, the function Fee_JobEndNotification shall set the job result to MEMIF_JOB_OK, else it shall leave the job result untouched. J()

Note: The function Fee_JobEndNotification shall be callable on interrupt level.

8.4.2 Fee JobErrorNotification

[FEE096]

Γ

Service name:	Fee_JobErrorNotification
Syntax:	void Fee_JobErrorNotification(
	void
Service ID[hex]:	0x11
Sync/Async:	Synchronous
Reentrancy:	Non Reentrant
Parameters (in):	None
Parameters	None
(inout):	
Parameters (out):	None
Return value:	None
Description:	Service to report to this module the failure of an asynchronous operation.

]()

The underlying flash driver shall call the function Fee_JobErrorNotification to report the failure of an asynchronous operation.

[FEE054] 「The function Fee_JobErrorNotification shall perform any necessary block management and error handling operations and subsequently call the job error notification routine of the upper layer module if configured. 」()

[FEE143] 「 If the job result is currently MEMIF_JOB_PENDING, the function Fee_JobErrorNotification shall set the job result to MEMIF_JOB_FAILED, else it shall leave the job result untouched. 」()

Note: The function Fee_JobErrorNotification shall be callable on interrupt level.

8.5 Scheduled functions

These functions are directly called by the Basic Software Scheduler. The following functions shall have no return value and no parameter. All functions shall be non reentrant.

8.5.1 Fee MainFunction

[FEE097]

Γ

Service name:	Fee_MainFunction	
Syntax:	void Fee_MainFunction(
	void	
Service ID[hex]:	0x12	
Timing:	ON_PRE_CONDITION	
Description:	Service to handle the requested read / write / erase jobs and the internal	
	management operations.	

]()

[FEE169] 「 If the module initialization (started in the function Fee_Init) is completed in the module's main function, the function Fee_MainFunction shall set the module status from MEMIF_BUSY_INTERNAL to MEMIF_IDLE once initialization of the module has been successfully finished. |()

[FEE057] Γ The function Fee_MainFunction shall asynchronously handle the read / write / erase / invalidate jobs requested by the upper layer and internal management operations. J()

[FEE075] 「The function Fee_MainFunction shall check, whether the block requested for reading has been invalidated by the upper layer module. If so, the function Fee_MainFunction shall set the job result to MEMIF_BLOCK_INVALID and call the error notification routine of the upper layer if configured. ()

[FEE023] [The function Fee_MainFunction shall check the consistency of the logical block being read before notifying the caller. If an inconsistency of the read data is detected, the function Fee_MainFunction shall set the job result to MEMIF_BLOCK_INCONSISTENT and call the error notification routine of the upper layer if configured. J(BSW14014, BSW14015, BSW14016)

Note: In this case, the upper layer must not use the contents of the data buffer.

[FEE179] If the current module status is MEMIF_BUSY_INTERNAL and if the internal management operation can be suspended without jeopardizing the data consistency: the function Fee_MainFunction shall save all information which is

necessary to resume the internal management operation, suspend the internal management operation and start processing the job requested by the upper layer. ()

[FEE180] 「 If the current module status is MEMIF_BUSY_INTERNAL and if the internal management operation can be aborted without jeopardizing the data consistency: the function Fee_MainFunction shall save all information which is necessary to restart the internal management operation, abort the internal management operation and start processing the job requested by the upper layer. |()

Note: Whether an internal management operation can be suspended or aborted depends on the type of management operation, the implementation of the FEE module and the capabilities of the underlying hardware and thus cannot be determined in this document.

[FEE181] Γ If an internal management operation has been suspended because of a job request from the upper layer, the function Fee_MainFunction shall resume this internal management operation once the job requested by the upper layer has been finished. $\Gamma(1)$

[FEE182] Γ If an internal management operation has been aborted because of a job request from the upper layer, the function <code>Fee_MainFunction</code> shall restart this internal management operation once the job requested by the upper layer has been finished. $\Gamma(I)$

8.6 Expected Interfaces

In this chapter all interfaces required from other modules are listed.

8.6.1 Mandatory Interfaces

This chapter defines all interfaces which are required to fulfill the core functionality of the module.

[FEE105] [

API function	Description
Fls_Cancel	Cancels an ongoing job.
	Compares the contents of an area of flash memory with that of an application data buffer.
Fls_Erase	Erases flash sector(s).
Fls_GetJobResult	Returns the result of the last job.
Fls_GetStatus	Returns the driver state.
Fls_Read	Reads from flash memory.
Fls_SetMode	Sets the flash driver's operation mode.
Fls_Write	Writes one or more complete flash pages.

1()

8.6.2 Optional Interfaces

This chapter defines all interfaces which are required to fulfill an optional functionality of the module.

[FEE104] [

API function	Description
Det_ReportError	Service to report development errors.

1()

8.6.3 Configurable interfaces

In this chapter all interfaces are listed where the target function could be configured. The target function is usually a callback function. The names of this kind of interfaces are not fixed because they are configurable.

Note: Depending on the implementation of the modules making up the NV memory stack, callback routines invoked by the FEE module may be called on interrupt level. The implementor of the module providing these routines therefore has to make sure that their runtime is reasonably short, i.e. since callbacks may be propagated upward through several software layers. Whether callback routines are allowable / feasible on interrupt level depends on the project specific needs (reaction time) and limitations (runtime in interrupt context). Therefore system design has to make sure that the configuration of the involved modules meets those requirements.

[FEE098]

Γ

Service name:	NvM_JobEndNotification			
Syntax:	void NvM_JobEndNotification(
	void			
Sync/Async:	true			
Reentrancy:	Don't care			
Parameters (in):	None			
Parameters	None			
(inout):				
Parameters (out):	None			
Return value:	None			
Description:				

]()

[FEE055] [The FEE module shall call the function defined in the configuration parameter FeeNvmJobEndNotification upon successful end of an asynchronous operation and after performing all necessary internal management operations:

- Read job finished & OK
- Write job finished & OK & block marked as valid

- Erase job for immediate data finished & OK (see <u>FEE067</u>)
- Invalidation of memory block finished & OK ()

The function defined in the configuration parameter FeeNvmJobEndNotification shall be callable on interrupt level.

[FEE099]

Γ

Service name:	NvM_JobErrorNotification			
Syntax:	void NvM_JobErrorNotification(
	void			
Sync/Async:	true			
Reentrancy:	Don't care			
Parameters (in):	None			
Parameters	None			
(inout):				
Parameters (out):	None			
Return value:	None			
Description:				

]()

[FEE056] \textsuperscript{The FEE module shall call the function defined in the configuration parameter FeeNvmJobErrorNotification upon failure of an asynchronous operation and after performing all necessary internal management and error handling operations:

- Read job finished & failed (e.g. block invalid or inconsistent)
- Write job finished & failed & block marked as invalid
- Erase job for immediate data finished & failed (see <u>FEE067</u>)
- Invalidation of memory block finished & failed |()

The function defined in the configuration parameter FeeNvmJobErrorNotification shall be callable on interrupt level.

9 Sequence diagrams

Note: For a vendor specific library, the following sequence diagrams are valid only insofar as they show the relation to the calling modules (Ecu_StateManager and memory abstraction interface). The calling relations from a memory abstraction module to an underlying driver are not relevant / binding for a vendor specific library.

9.1 Fee Init

The following figure shows the call sequence for the Fee_Init routine. It is different from that of all other services of this module as it is not called by the NVRAM manager and not called via the memory abstraction interface.

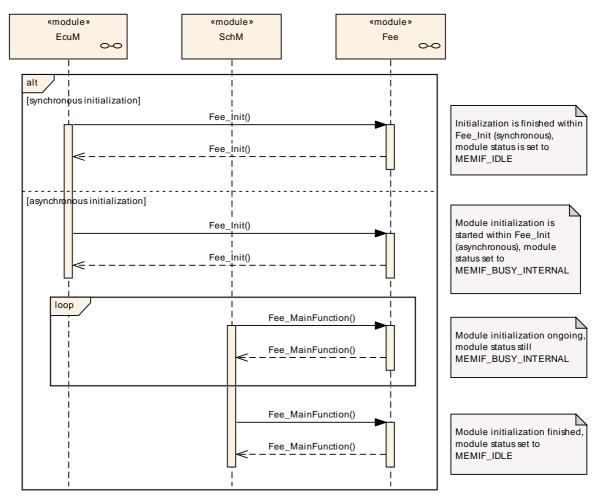

Figure 5: Sequence diagram of "Fee_Init" service

9.2 Fee SetMode

The following figure shows exemplarily the call sequence for the Fee_SetMode service. This sequence diagram also applies to the other synchronous services of this module with exception of the Fee_Init routine (see above).

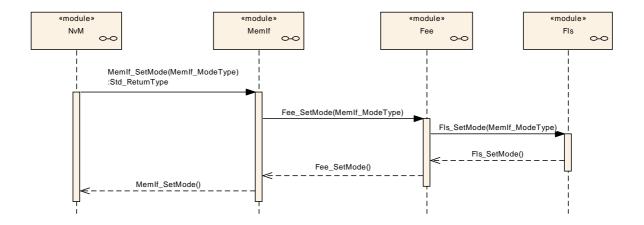

Figure 6: Sequence diagram of the "Fee_SetMode" service

9.3 Fee_Write

The following figure shows exemplarily the call sequence for the Fee_Write service. This sequence diagram also applies to the other asynchronous services of this module.

Specification of Flash EEPROM Emulation V2.0.0

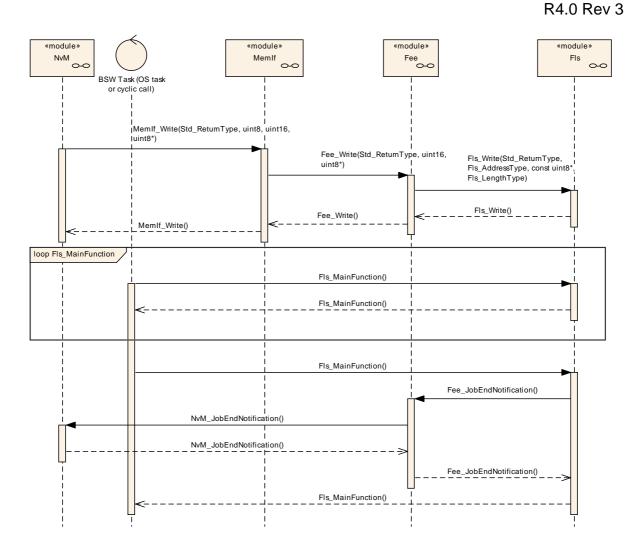

Figure 7: Sequence diagram "Fee_Write"

9.4 Fee_Cancel

The following figure shows as an example the call sequence for a canceled Fee_Write service and a subsequent new Fee_Write request. This sequence diagram shows that Fee_Cancel is asynchronous w.r.t. the underlying hardware while itself being synchronous.

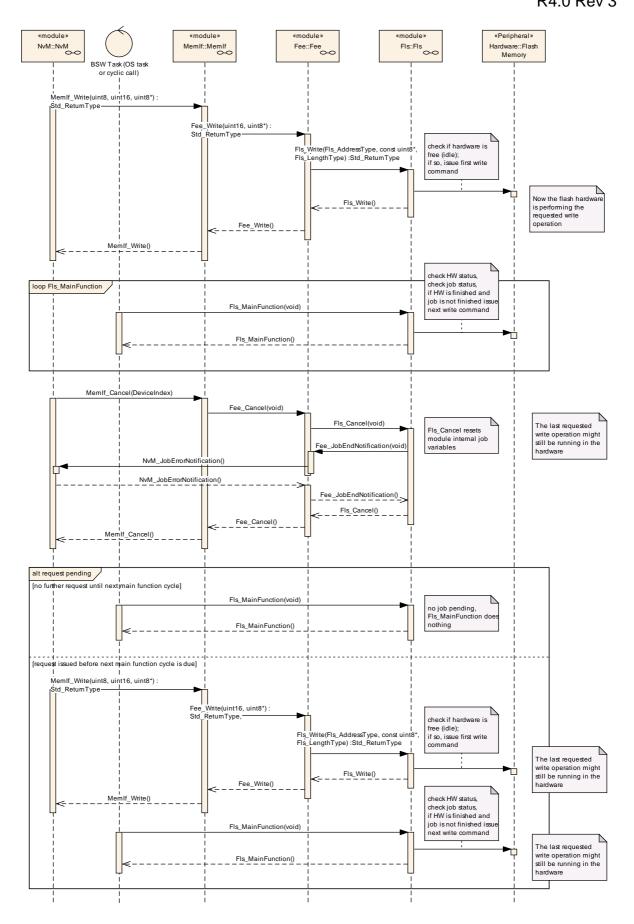

Figure 8: Sequence diagram "Fee_Cancel"

10 Configuration specification

10.1 How to read this chapter

In addition to this section, it is highly recommended to read the documents:

- AUTOSAR Layered Software Architecture [2]
- AUTOSAR ECU Configuration Specification [7]
 This document describes the AUTOSAR configuration methodology and the AUTOSAR configuration metamodel in detail.

The following is only a short survey of the topic and it will not replace the ECU Configuration Specification document.

10.1.1 Configuration and configuration parameters

Configuration parameters define the variability of the generic part(s) of an implementation of a module. This means that only generic or configurable module implementation can be adapted to the environment (software/hardware) in use during system and/or ECU configuration.

The configuration of parameters can be achieved at different times during the software process: before compile time, before link time or after build time. In the following, the term "configuration class" (of a parameter) shall be used in order to refer to a specific configuration point in time.

10.1.2 Containers

Containers structure the set of configuration parameters. This means:

- all configuration parameters are kept in containers.
- (sub-) containers can reference (sub-) containers. It is possible to assign a multiplicity to these references. The multiplicity then defines the possible number of instances of the contained parameters.

10.1.3 Specification template for configuration parameters

The following tables consist of three sections:

- the general section
- the configuration parameter section
- the section of included/referenced containers

Pre-compile time

- specifies whether the configuration parameter shall be of configuration class *Pre-compile time* or not

Label	Description
х	The configuration parameter shall be of configuration class <i>Pre-compile time</i> .
	The configuration parameter shall never be of configuration class <i>Pre-compile time</i> .

Link time

 specifies whether the configuration parameter shall be of configuration class Link time or not

Label	Description
Х	The configuration parameter shall be of configuration class <i>Link time</i> .
	The configuration parameter shall never be of configuration class Link time.

Post Build

 specifies whether the configuration parameter shall be of configuration class Post Build or not

Label	Description
х	The configuration parameter shall be of configuration class <i>Post Build</i> and no specific implementation is required.
L	Loadable – the configuration parameter shall be of configuration class Post Build and only one configuration parameter set resides in the ECU.
М	Multiple – the configuration parameter shall be of configuration class Post Build and is selected out of a set of multiple parameters by passing a dedicated pointer to the init function of the module.
	The configuration parameter shall never be of configuration class <i>Post Build</i> .

10.2 Containers and configuration parameters

The following chapters summarize all configuration parameters. The detailed meanings of the parameters describe Chapters 7 and Chapter 8.

10.2.1 Variants

[FEE167] The FEE module shall support (only) the following configuration variants:

VARIANT-PRE-COMPILE
 Only parameters with "Pre-compile time" configuration are allowed in this variant. ()

10.2.2 Fee

Module Name	Fee			
Woodile Description	Configuration of the Fee (Flash EEPROM Emulation) module.			

Included Containers				
Container Name Multiplicity Scope / Dependency				
FeeBlockConfiguration		Configuration of block specific parameters for the Flash EEPROM Emulation module.		
FeeGeneral	1	Container for general parameters. These parameters are not		

		specific to a block.
FeePublishedInformatio n	1	Additional published parameters not covered by CommonPublishedInformation container. Note that these parameters do not have any configuration class setting, since they are published information.

10.2.4 FeeBlockConfiguration

SWS Item	FEE040_Conf:
Container Name	FeeBlockConfiguration{FEE_BlockConfiguration}
II Jescrintinn	Configuration of block specific parameters for the Flash EEPROM Emulation module.
Configuration Parai	meters

SWS Item	FEE150_Conf:					
Name	FeeBlockNumber {FEE_B	LOCK_NL	JMBER}			
Description	block numbers (see FÉE0 2^NVM_DATASET_SELE 2^NVM_DATASET_SELE number of bits set aside fo	Block identifier (handle). 0x0000 and 0xFFFF shall not be used for block numbers (see FEE006). Range: min = 2^NVM_DATASET_SELECTION_BITS max = 0xFFFF - 2^NVM_DATASET_SELECTION_BITS Note: Depending on the number of bits set aside for dataset selection several other block numbers shall also be left out to ease implementation.				
Multiplicity	1	1				
Туре	EcucIntegerParamDef (Sy parameter)	EcucIntegerParamDef (Symbolic Name generated for this parameter)				
Range	1 65534					
Default value						
ConfigurationClass	Pre-compile time	Pre-compile time X All Variants

SWS Item	FEE149 Conf :			
Name	FeeDeviceIndex {FEE_DEVICE_INDEX}			
Description	Device index (handle). Range: 0 254 (0xFF reserved for broadcast call to GetStatus function).			
Multiplicity	1	1		
Туре	Reference to [FlsGeneral]			
ConfigurationClass	Pre-compile time	Х	All Variants	
	Link time			
	Post-build time			
Scope / Dependency	manager respectively the to address a certain log specification to give a contract of the total contract of th	scope: module dependency: This information is needed by the NVRAM manager respectively the Memory Abstraction Interface to address a certain logical block. It is listed in this specification to give a complete overview over all block related configuration parameters.		

No Included Containers

10.3 Published Information

[FEE185] \(\text{The standardized common published parameters as required by BSW00402 in the General Requirements on Basic Software Modules [3] shall be published within the header file of this module and need to be provided in the BSW Module Description. The according module abbreviation can be found in the List of Basic Software Modules [1]. \(\)()

Additional module-specific published parameters are listed below if applicable.

10.3.1 FeePublishedInformation

SWS Item	FEE043_Conf:
Container Name	FeePublishedInformation
Description	Additional published parameters not covered by CommonPublishedInformation container. Note that these parameters do not have any configuration class setting, since they are published information.
Configuration Parameters	

SWS Item	FEE117_Conf:	FEE117_Conf:		
Name	FeeBlockOverhead {FEE_BL0	FeeBlockOverhead {FEE_BLOCK_OVERHEAD}		
Description	management overhead dependence location a formula has to be p	Management overhead per logical block in bytes. Note: If the management overhead depends on the block size or block location a formula has to be provided that allows the configurator to calculate the management overhead correctly.

11 Changes w.r.t. Release 4.0

11.1 Deleted SWS Items

SWS Item	Rationale
FEE038	No longer appropriate

11.2 Replaced SWS Items

SWS Item	replaced by SWS Item	Rationale

11.3 Changed SWS Items

SWS Item	Rationale
FEE002	NvM_Cbk.h added to file include structure in chapter 5.1.2
FEE150_Conf, FEE148_Conf	Ranges for FeeBlockNumber and FeeBlockSize adjusted
FEE120	Initialization might not be finished withing Fee_Init, state machine adapted accordingly.
FEE010, FEE020, FEE022, FEE025, FEE133, FEE144, FEE080, FEE081, FEE164, FEE128, FEE129, FEE145, FEE146, FEE052, FEE054, FEE075, FEE023	Handling of internal management operations refined.
FEE013	Inter module checks detailed
FEE150 Conf	Naming corrected to NVM_DATASET_SELECTION_BITS
9.1	Sequence diagram for Fee_Init extended.
9.4	Sequence diagram for Fee_Cancel replaced for generated one.
FEE013	Inter-modul checks clarified.
FEE013	
FEE010	RfC #46721: Note added regarding internal management operations.
<u>FEE085</u>	RfC #46718: Fee_Init changed to asynchronous
FEE087, FEE088	RfC #46722: Removed dependency to DET.

11.4 Added SWS Items

SWS Item	Rationale
FEE168, FEE169	Initialization might not be finished withing Fee_Init, state machine adapted
<u>FEE 100, FEE 109</u>	accordingly.
FEE170, FEE171,	
FEE172, FEE173,	Llandling of internal management analystic na votice of
FEE174, FEE175,	Handling of internal management operations refined.
FEE176, FEE177,	

Specification of Flash EEPROM Emulation V2.0.0 R4.0 Rev 3

FEE178, FEE179,	
FEE180, FEE181,	
FEE182, FEE183
