## 1 Introduction and functional overview

This specification specifies the functionality, API and the configuration of the AUTOSAR Basic Software module Flash Test driver.

This Flash test module provides algorithm to test invariable memory. Invariable memory can be data/program flash, program SRAM, locked cache and is either embedded in the microcontroller or memory mapped connected to the microcontroller. For simplification the SW module is called Flash Test driver.

The test service can be executed at any time after MCU initialization and it is up to the user of the Flash Test Driver to choose the suitable test algorithm and the right execution place to fulfill the safety requirements of the system. The test service itself is dependant on the storage concept of the system. Therefore, the availability of different test algorithms is configurable.

The Flash Test driver is intended to be integrated in the overall safety concept and will not provide the required diagnostic coverage on its own.

## 7 Functional specification

### 7.1 General behavior

**[SWS\_FlsTst\_00137]** 「The Flash test module provides test execution services in background and foreground mode (see also chapter 2). 」 (SRS\_FlsTst\_14219)

**[SWS\_FlsTst\_00138]** 「The memory blocks to be tested shall be configurable for background and foreground mode separately (see ECUC\_FlsTst\_00103, ECUC\_FlsTst\_00104). 」 ()

**[SWS\_FlsTst\_00139]** 「In background mode the test blocks shall be tested in the same order they are configured in configuration structure. When all blocks are tested, one test interval is completed (see Figure 2). In background testing the partial tests shall be triggered via FlsTst\_MainFunction (see [SWS\\_FlsTst\\_00066](#)). 」 (SRS\_FlsTst\_14209)

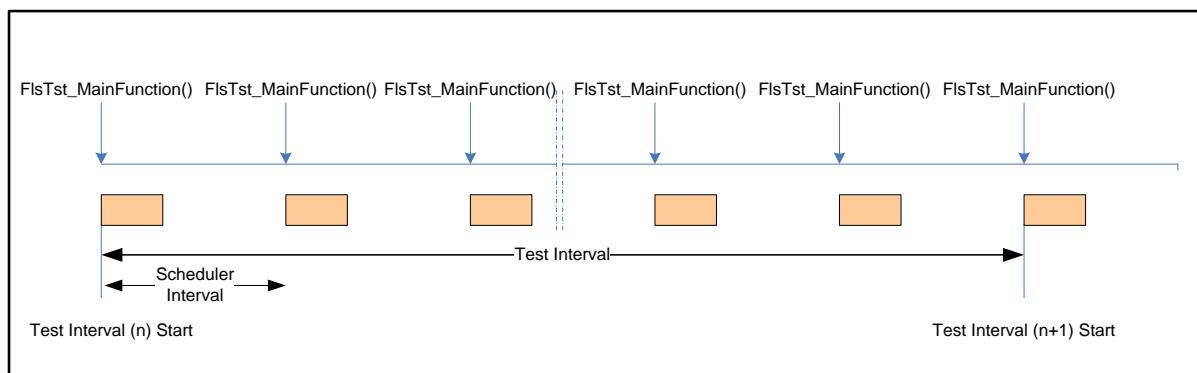

Figure 2: Background Test: Test Interval

**[SWS\_FlsTst\_00140]** 「The length of a partial test is defined by the number of tested cells, which shall be tested in one scheduled task. (see ECUC\_FlsTst\_00119). The required time for a partial test without interruption is defined as “Test time”. 」 ()

Note: The partial test can be interrupted by a higher priority task at any time, because the Flash test does not require atomic sequences. It is the responsibility of the user to ensure that the interruptible partial test is finished before the scheduler interval is started(See Figure 3).

**[SWS\_FlsTst\_00142]** 「A background test shall be aborted or suspended via the API services FlsTst\_Abort() or FlsTst\_Suspended(). The maximum latency time until the API call request is processed, shall be configurable (see ECUC\_FlsTst\_00120). 」 ()

**[SWS\_FIsTst\_00156]** [Each Flash test Interval shall have an Identifier, which shall be incremented by each start of a new test interval in background mode.] ()

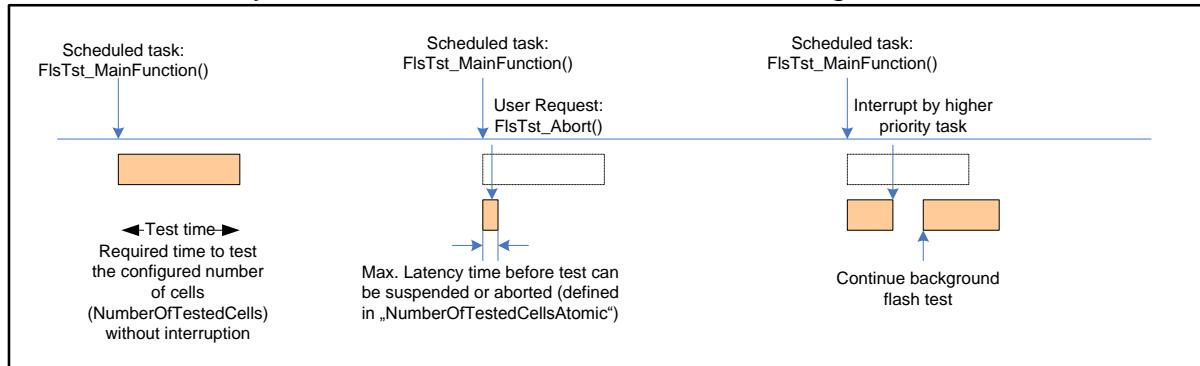

Figure 3: Background Test: Test Process

### 7.1.1 State Diagram

The Flash test driver states in background mode are described in Figure 4. The described states are driver states in background operation mode.

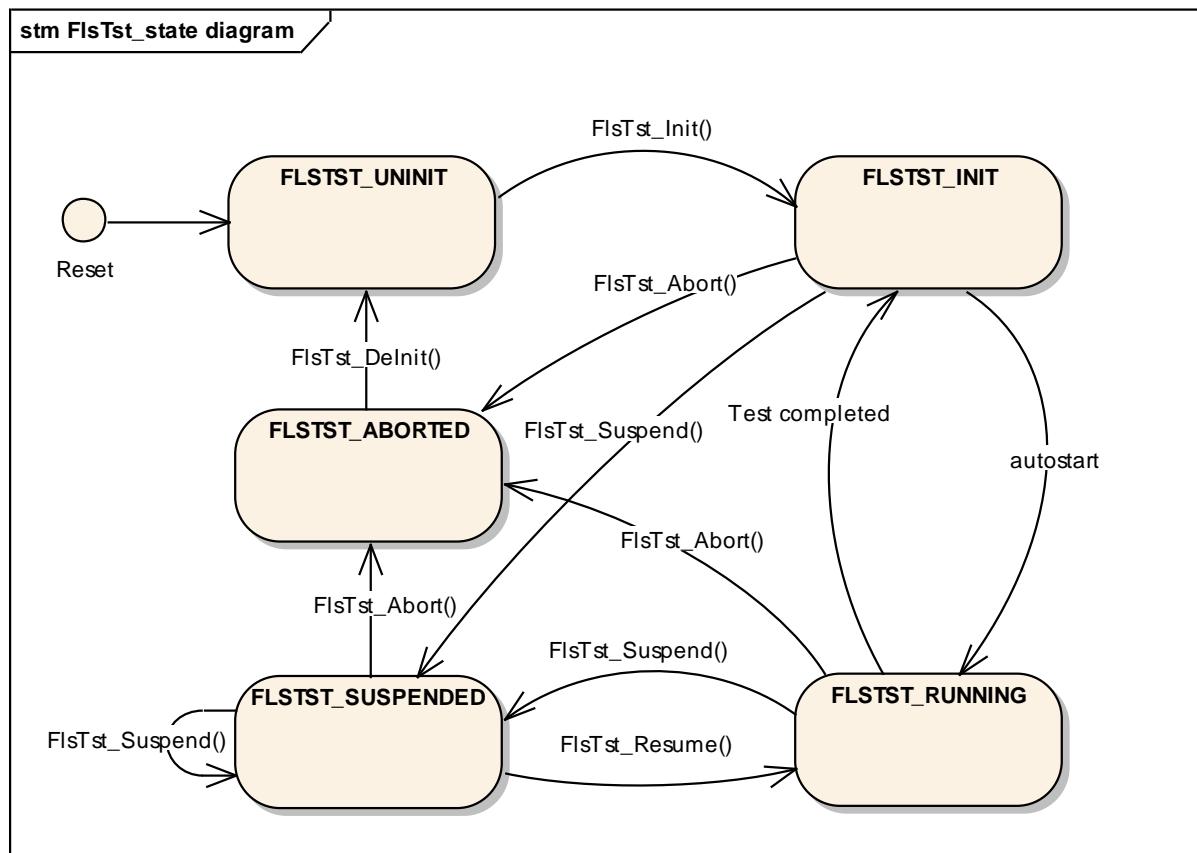

Figure 4: State Diagram – Background mode

**[SWS\_FIsTst\_00143]** [Foreground tests are defined as synchronous tests which shall not be interrupted. The execution of Foreground tests is configurable (see

ECUC\_FlsTst\_00086) and can be called after module initialization at any time. ]  
 (SRS\_FlsTst\_14219)

## 7.2 Error Classification

## 7.7 Error Detection

**[SWS\_FlsTst\_00011]** [The function `FlsTst_Init` shall be called first before calling any other Flash Test functions except the function `FlsTst_GetCurrentState`. If this sequence is not respected, the error code `FLSTST_E_UNINIT` shall be reported to the Default Error Tracer (if development error detection is enabled). ]

<i>API function</i>	<i>Description</i>
<code>Dem_ReportErrorStatus</code>	Queues the reported events from the BSW modules (API is only used by BSW modules). The interface has an asynchronous behavior, because the processing of the event is done within the Dem main function.  OBD Events Suppression shall be ignored for this computation.

### 8.6.2 Optional Interfaces

This chapter defines all interfaces that are required to fulfill an optional functionality of the module.

### 8.6.3 Configurable interfaces

In this chapter, all interfaces are listed where the target function could be configured. The target function is usually a callback function. The names of these kinds of interfaces are not fixed because they are configurable.

**[SWS\_FIsTst\_00074]** [The callback notifications shall be configurable as function pointers within the initialization data structure (FIsTst\_ConfigType). ] ()
